

MANAGEMENT OF THE
CALIFORNIA
STATE WATER
PROJECT

BULLETIN 132-12 | AUGUST 2014

50TH EDITION

EDMUND G. BROWN JR.
Governor, State of California

JOHN LAIRD
*Secretary for Natural Resources
California Natural Resources Agency*

MARK W. COWIN
Director, Department of Water Resources

Bulletin 132-12

Management of the California State Water Project

Covers Calendar Year 2011 Activities

50th Edition
Published August 2014

Edmund G. Brown Jr. *Governor*
State of California

John Laird *Secretary for Natural Resources*
California Natural Resources Agency

Mark W. Cowin *Director*
Department of Water Resources

Foreword

*B*ulletin 132-12, Management of the California State Water Project, continues the Bulletin 132 annual series begun in 1963. Bulletin 132-12 reports water supply planning, construction, financing, management, and operation activities of the State Water Project (SWP). Appendix B contains data and computations used to determine the SWP water contractors' Statements of Charges for 2013. Appendix B was previously printed and distributed to SWP water contractors to document and support calculation of contractors' annual charges.

The Bulletin discusses significant events and issues that affect SWP management and operations. The Bulletin covers the period from January 1, 2011, through December 31, 2011.

Bulletin 132-12 also discusses water supply and delivery as well as Delta resources and environmental issues, local assistance programs, power resources, recreation, and financial analysis of the State Water Project.

Please note that the water delivery figures listed are accurate at the time of this Bulletin 132 publication, but small volumes of water may be reclassified over time pursuant to long-term water supply contract provisions. If your research requires more current data than were available at the time of publication, please consult the most recent edition of Bulletin 132 or contact DWR staff in the State Water Project Analysis Office.

Mark W. Cowin
Director

California Water Commission

The California Water Commission consists of nine members appointed by the Governor and confirmed by the Senate. Seven members are chosen for their expertise related to the control, storage, and beneficial use of water, and two are chosen for their knowledge of the environment. The commission advises the Director of the Department of Water Resources (DWR) on matters within DWR's jurisdiction, approves rules and regulations, and monitors and reports on the construction and operation of the State Water Project (SWP).

The roles and responsibilities of the California Water Commission are defined in the Water Code, Government Code, and Code of Civil Procedure.

The commission's SWP-specific responsibilities are to:

- conduct an annual review of the construction and operation of the SWP and report to DWR and the Legislature with any recommendations (Water Code Section 165);
- hold public hearings on all additional facilities proposed to be added to the SWP and name any new facilities (Water Code Sections 161.5 and 166); and
- adopt a resolution of necessity, and give each affected person a venue to be heard, before DWR may commence an eminent domain proceeding (Code of Civil Procedure Section 1245.210).

Commission members at the time of publication are:

Joseph Byrne (Chair)

Andrew Ball

Daniel Curtin

Joe Del Bosque (Vice-Chair)

Kimberley Delfino

Luther Hintz

David Orth

Anthony Saracino

SWP Long-term Water Contractors

The State Water Project long-term water supply contractors are listed below, followed by shortened forms of their names that are used in Bulletin 132.

Alameda County Flood Control and Water Conservation District, Zone 7	Alameda-Zone 7
Alameda County Water District	Alameda County
Antelope Valley-East Kern Water Agency	AVEK
Castaic Lake Water Agency	Castaic Lake
City of Yuba City	Yuba City
Coachella Valley Water District	Coachella
County of Butte	Butte
County of Kings	Kings
Crestline-Lake Arrowhead Water Agency	Crestline
Desert Water Agency	Desert
Dudley Ridge Water District	Dudley Ridge
Empire West Side Irrigation District	Empire
Kern County Water Agency	Kern
Littlerock Creek Irrigation District	Littlerock
The Metropolitan Water District of Southern California	Metropolitan
Mojave Water Agency	Mojave
Napa County Flood Control and Water Conservation District	Napa
Oak Flat Water District	Oak Flat
Palmdale Water District	Palmdale
Plumas County Flood Control and Water Conservation District	Plumas
San Bernardino Valley Municipal Water District	San Bernardino
San Gabriel Valley Municipal Water District	San Gabriel
San Geronio Pass Water Agency	San Geronio
San Luis Obispo County Flood Control and Water Conservation District	San Luis Obispo
Santa Barbara County Flood Control and Water Conservation District	Santa Barbara
Santa Clara Valley Water District	Santa Clara
Solano County Water Agency	Solano
Tulare Lake Basin Water Storage District	Tulare
Ventura County Watershed Protection District	Ventura

State Water Project Highlights

Sunset over the California Aqueduct.

The annual Bulletin 132 series began in 1963 and reported the first deliveries of water by the new State Water Project (SWP). Bulletin 132-12, *Management of the California State Water Project*, continues this series as the fiftieth edition. It reports on SWP planning, construction, finance, management, and operations during calendar year 2011. The SWP is operated and maintained by the California Department of Water Resources (DWR).

The SWP is one of the world's largest water, power, and conveyance systems. In the past decade it has conveyed an annual average of 2.9 million acre-feet (maf) of water. SWP facilities—pumping and power plants; reservoirs, lakes, and storage tanks; canals, tunnels, and pipelines—capture, store, and convey water to public water agencies and local water districts.

50th Edition of Bulletin 132

Bulletin 132-12 marks the 50th edition of the Bulletin 132 annual publication. The first edition of this comprehensive series was published in April 1963, entitled *The California State Water Project in 1963*, when Edmund G. "Pat" Brown was governor.

Former DWR Director Ronald B. Robie Honored

On September 21, 2011, California Water Commission members unanimously approved the renaming of SWP's Thermalito Pumping-Generating Plant in honor of former DWR Director Ronald B. Robie. The facility's new name is the Ronald B. Robie Thermalito Powerplant.

Drought

On March 30, 2011, the Governor proclaimed an end to the State's drought. The Governor's Proclamation officially rescinded Executive Order S-06-08 and ended the States of Emergency called in June 2008 and February 2009 relating to water shortage associated with the drought.

For more information, see Chapter 3, Environmental Programs.

Yearly Activities Summary

2011 Precipitation and Water Storage

Water stored and delivered by the SWP conservation and transportation facilities originates from rainfall and snowmelt in Northern and Central California watersheds, where most of the State's precipitation occurs. DWR monitors and records annual precipitation and runoff during each water year, which begins on October 1 and ends on September 30.

Precipitation and Snowpack in Water Year 2010–2011

California experienced above-average rainfall and mountain snowpack during water year 2010–2011. The state received precipitation at 135 percent of average in 2010–2011, compared to 108 percent of average in 2009–2010. The Northern Sierra 8-Station Precipitation Index finished the water year with 72.7 inches of precipitation (145 percent of average). The statewide average snow water equivalent, based on snow sensors, reported for April 1 was 47.7 inches, or 165 percent of average.

The Sacramento Valley Water Year Hydrologic Classification (Sacramento Valley 40-30-30 Index) and the San Joaquin Valley Water Year Hydrologic Classification (San

Joaquin Valley 60-20-20 Index) were both considered “wet,” based on all observed data for water year 2010–2011.

Runoff

Statewide unimpaired runoff totaled 146 percent of average in the 2010–2011 water year. Runoff in the Sacramento River and San Joaquin River regions was 135 and 184 percent of average, respectively.

Water Year 2010–2011 Storage Totals

At the end of the 2010–2011 water year, water storage in major SWP reservoirs and the State’s share of joint-use reservoirs was 4.64 maf or 85 percent of maximum storage, compared to 2.81 maf or 52 percent of maximum storage at the end of water year 2009–2010. The average end-of-month total storage for the 2010–2011 water year in major SWP reservoirs was 4.27 maf. End-of-water-year storage on September 30, 2011, at Lake Oroville was 3.04 maf, which was about 1.29 maf more than the previous water year.

Calendar Year 2011 Storage Total

The total storage in major SWP reservoirs was about 4.10 maf at the end of 2011, compared with 3.58 maf in 2010. The State’s share of San Luis Reservoir storage was 964,240 acre-feet (af) on December 31, 2011, compared with 802,515 af at the same time in 2010. The combined storage in the southern reservoirs was 586,234 af on December 31, 2011, compared with 601,004 af at the same time in 2010.

Diversions from the Delta

In 2011, the SWP diverted 3,879,762 af at Banks Pumping Plant. There was no Cross Valley Canal water or Central Valley Project water wheeled at Banks Pumping Plant by DWR during 2011.

Maximum daily Delta exports occurred on January 8, 2011, at 25,129 af. Combined

SWP and CVP monthly Delta exports in 2011 varied from a low of 210,509 af in May, to a high of 708,463 af in August. In 2011, Delta exports totaled approximately 6.5 maf.

For more information, see Chapter 8, Water Supply.

2011 Water Supplies, Contracts, and Deliveries

2011 Water Deliveries

DWR approved 1.04 maf on November 22, 2010, resulting in initial Table A amounts of 25 percent of most SWP water contractor requests. DWR increased the 2011 Table A amounts to 3.34 maf, or 80 percent, on April 20, 2011, for the final allocation. For more information on changes in Table A amounts that were approved by DWR, see Chapter 9, Water Contracts and Deliveries.

In 2011, 4,630,798 af of SWP and non-SWP water was delivered to 29 long-term SWP water contractors and 24 other agencies.

The portion delivered to the SWP water contractors was 3,348,931 af, categorized as follows:

- 2,512,484 af of total 2011 Table A water;
- 12,331 af of transferred Table A water;
- 23,383 af of exchanged Table A water;
- 31,061 af of Pool A and Pool B water;
- 420,814 af of Article 21 water;
- 268,313 af of 2010 carryover water (Article 12(e) and Article 56(c));
- 39,549 af recovered from water banks;
- 36,531 af of flexible storage withdrawal;
- 2,872 af of settlement water; and
- 1,593 af of SWP water for recreation and fish and wildlife.

The remaining portion was delivered to 24 non-SWP agencies and

totaled 1,281,867 af, which was categorized accordingly:

- 1,064,507 af of local water;
- 1,141 af of permit water; and
- 216,219 af delivered to satisfy agreements between the SWP and CVP.

Table H-1 shows SWP water deliveries by category for 1962 through 2011.

For more information, see Chapter 9, Water Contracts and Deliveries.

Power Resources

In 2011, DWR sold 1.19 million megawatt hours of energy to one utility and seven WSPP power marketers for a total revenue of \$43.72 million. DWR also received \$84.00 million in revenues for capacity and other energy-related services, including \$81.47 million for transactions made through the California Independent System Operator.

The sidebar, State Water Project Power Generation and Consumption in 2011, summarizes amounts of power generated and consumed by the SWP. For detailed information, see Chapter 10, Power Resources.

Oroville Facilities Relicensing

On January 26, 2005, DWR filed an application with the Federal Energy Regulatory Commission (FERC) requesting a new license for the Oroville Facilities (FERC Project No. 2100). The existing 50-year hydropower license expired January 31, 2007, and, until a new license is issued, FERC is issuing annual licenses. The new hydropower license is currently expected sometime in 2014 or later. A partial list of SWP facilities that will be subject to the new license terms and conditions is available in Chapter 10, Power Resources.

A number of significant events associated with Oroville Facilities relicensing occurred in 2011. For details, see Chapter 3, Environmental Programs; Chapter 6, Legislation and Litigation; Chapter 10, Power Resources; and Chapter 13, Recreation.

Financial Analysis

In 2011, DWR continued to pay bondholders as scheduled. The SWP was financially viable and was indirectly paid for by the approximately 25 million water users served by the project. Direct payment was through the 29 long-term water contractors. In 2011, the SWP handled approximately \$1.04 billion in revenues and \$1.04 billion in expenses. The 2011 Income Statement for the State Water Project sidebar presents a summary of the year's revenues and expenses. For detailed information, see Chapter 14, Financial Analysis.

Engineering, Construction, and Real Estate

In 2011, engineering, construction, and real estate work to enhance, expand, repair, and protect the SWP and other facilities within the State continued. Significant projects included the South Bay Aqueduct enlargement, South Bay Pumping Plant expansion, Edmonston Pumping Plant refurbishment, Hyatt Powerplant pump-turbine refurbishment, and East Branch Extension Phase I improvements and Phase II projects.

DWR worked on 61 construction contracts in 2011. Projects included turbine and pump replacement, pipeline repair, trash rack upgrade at fish hatcheries, and recreational and maintenance facilities improvements at dam and reservoir sites.

DWR processed a net total of \$3.8 million in payments in 2011 in support of right-of-way activities required for the construction, operation, and maintenance of the SWP. DWR also conducted real estate

Table H-1 SWP Water Delivered by Category, 1962–2011 (acre-feet)

Delta Resources and Environmental Issues

Delta Stewardship Council

In November 2011, the draft program environmental impact report for the Delta Stewardship Council's *Delta Plan* was released for public review and comment.

Delta Risk Management Strategy

The Delta Risk Management Strategy Phase 2 identified and analyzed measures to reduce risks to the Delta and the State from the consequences of levee failure. In 2011, the Delta Risk Management Strategy project released the Phase 2 report.

Delta Smelt Abundance

The abundance index for Delta Smelt rose significantly in 2011 to a value nearly 12 times higher than in 2010. This was the highest observed index for Delta Smelt in a decade.

Spring-run Chinook Salmon

In June 2011, DWR increased flows in the upper reaches of the lower Feather River to benefit spring-run Chinook Salmon. Flows were increased June 20–25, from 700 cubic feet per second to 2,600 cubic feet per second, to attract additional spring-run Chinook Salmon to the Feather River Fish Hatchery.

Fish Restoration Program

Pursuant to the Fish Restoration Program Agreement, DWR and the Department of Fish and Wildlife began developing a strategy for implementing restoration actions to satisfy DWR's obligations under the biological

opinions and incidental take permit. A draft was distributed to stakeholders for public review in fall 2011.

Climate Change

In 2011, several climate change studies were initiated or ongoing. For more information, see Chapter 3, Environmental Programs.

The *Climate Change Handbook for Regional Water Planning* was released in December. The handbook provides resources and tools to guide water resource managers and planners as they develop ways to adapt their programs to a changing climate. The handbook was developed cooperatively by DWR, the U.S. Environmental Protection Agency, Resources Legacy Fund, and U.S. Army Corps of Engineers. The handbook is available on DWR's website.

Suisun Marsh

The final environmental impact statement/environmental impact report for the *Suisun Marsh Habitat Management, Preservation, and Restoration Plan* was completed in November 2011.

Recreation

In 2011, SWP facilities supported an estimated 4.1 million recreation days of use, down somewhat from the 4.3 million reported in 2010. In 2011, SWP recreation use was concentrated at the lakes and major reservoirs, with 38 percent occurring in the Oroville Field Division and 43 percent occurring at the four major reservoirs in Southern California. For further recreation information, see Chapter 13, Recreation.

SWP Security Measures

Security and protection of the SWP remain primary goals for DWR. SWP facilities are closely monitored, and DWR staff are vigilant in maintaining a secure environment. Security patrols of SWP facilities are frequent and ongoing, and plans are in place to

State Water Project Power Generation and Consumption in 2011

Power Generation and Consumption	Megawatt Hours
Energy generation by SWP facilities	4,846,000
Energy sources and firm purchases under agreements and exchanges	4,895,000
Total Energy Available to the SWP	9,741,000
Energy sales	(1,192,000)
Net SWP Power Consumption	8,549,000

address potential or actual acts of terrorism. Security system improvements continue in conjunction with the Bureau of Reclamation and other federal and State agencies.

SWP Milestones through the Decades

50 Years Ago—1961

Construction began on SWP facilities, including Oroville Dam, on the Feather River in the upper Sacramento Valley.

The State and federal governments signed an agreement to build the San Luis Joint-Use Facilities for storage, pumping, and conveyance for State and federal water operations.

40 Years Ago—1971

In June, water storage in Lake Oroville reached the maximum design capacity of 3,537,577 af for the first time.

In October, Governor Ronald Reagan started the first pump at Edmonston Pumping Plant as part of a ceremony celebrating the first water deliveries to Southern California.

By the end of 1971, 99.7 percent of the facilities required to fulfill initial water delivery commitments were either completed or under construction.

30 Years Ago—1981

DWR celebrated its 25th anniversary at the Sacramento Convention Center.

In May, the California Water Commission renamed the Delta Pumping Plant in honor of Harvey O. Banks, the first director of DWR.

20 Years Ago—1991

The year 1991 was the driest single year of California's multiyear statewide drought that lasted from 1987 to 1992.

2011 Income Statement for the State Water Project

Revenues	Thousands of Dollars
Water Contract Payments	1,105,849
Revenue Bond Cover Adjustments	(51,933)
Rate Management Adjustments	(27,880)
Other Revenues	18,614
Total Operating Revenues^a	1,044,650
Expenses	
Project Operations, Maintenance, Power, and Replacement	735,374
Deposits to Reserves	1,809
Water Bond Principal	173,424
Water Bond Interest	134,042
Total Operating Expense and Debt Service^a	1,044,650
Net System Revenues	0

^a Totals may not sum due to rounding.

California began its first statewide water transfer program, the Drought Water Bank. Established through Executive Order by the Governor in February 1991, the bank was administered by DWR to facilitate transfers and sales of water during the drought to meet water needs.

The South Delta Temporary Barriers Project was initiated in response to a lawsuit filed in 1982 by the South Delta Water Agency against DWR.

10 Years Ago—2001

The CALFED Bay-Delta Program's Environmental Water Account completed its first year of operation. It provided 287,000 af of water for environmental purposes without reducing SWP deliveries.

Crafton Hills Reservoir was completed in August.

Chapter 1

The State Water Project

California poppy (*Eschscholzia californica*).

*T*his chapter primarily provides background on the State Water Project (SWP), including brief descriptions of SWP facilities, planning, construction, power operations, financing, contracting agencies, and the project's many uses and functions. It also provides a glimpse of California history, with a look at the processes and decisions that went into the creation of the largest state-built water project in the country.

Chapters 2 through 15 provide more detail on significant events and specific topics related to management of the SWP in calendar year 2011. At the end of the bulletin, Appendix B presents data and computations used to determine the SWP Contractors' Statements of Charges for 2013.

Information in this chapter was contributed by the Division of Operations and Maintenance and the State Water Project Analysis Office.

California's diverse geography contains both the highest and lowest elevations in the coterminous United States, with a resulting diversity of climate that ranges from desert to alpine to subtropical. In a typical year, some areas receive as little as 2 inches of rain, while others receive more than 100 inches. This diversity of geography and climate creates an intricate and constantly changing pattern of water supplies, which, in turn, creates enormous challenges in managing this vital resource.

The State Water Project

Like present-day Californians, the earliest settlers faced the problem of how best to conserve, control, and deliver water. Remains of aqueducts, canals, and dams are still found near some of California's original missions. The first recorded aqueduct, built in 1770 to serve the San Diego mission, was 6 miles long. In the early twentieth century, several cities, including San Francisco and Los Angeles, built aqueducts to convey water from the Sierra Nevada to other parts of the State.

In 1951, after many years of discussion and study, the Legislature authorized construction of a water storage and supply system to capture and store rainfall and snowmelt runoff in Northern California and deliver it to areas of need throughout the State. Eight years later, the Legislature passed the Burns-Porter Act, which provided the mechanism for obtaining funds necessary to construct the initial State Water Project (SWP) facilities. In 1960, California voters approved an issue of \$1.75 billion in general obligation bonds, as authorized in the act, thereby securing funds to build the SWP. In 1962, the first water was delivered through a portion of the South Bay Aqueduct to two long-term contracting agencies in Alameda County.

Today the SWP, built, operated, and managed by the Department of Water Resources (DWR), is the largest state-built,

multipurpose, user-financed water project in the country. It was designed and built to deliver water, control flooding, generate power, provide recreational opportunities, and enhance habitat for fish and wildlife. SWP water irrigates about 750,000 acres of farmland, mainly in the southern San Joaquin Valley. Approximately 25 million of California's estimated 37 million residents benefit from SWP water.

Precipitation and Runoff

The water stored and delivered by the SWP originates from rainfall and snowmelt runoff in Northern and Central California's watersheds, where most of the State's precipitation occurs.

Since 1968, DWR has monitored and recorded annual precipitation and runoff, because precipitation, snowpack, and the rate and amount of snowmelt help determine how much water the SWP can deliver in any given year. The DWR-designated water year is October 1 through September 30.

Water Delivery Facilities

The SWP depends on a complex system of dams, reservoirs, power plants, pumping plants, canals, and aqueducts to deliver water. Although initial water transportation facilities were essentially completed in 1973, other facilities have since been built, and still others are either under construction or are planned to be built, as needed.

The SWP facilities include 30 dams (29 of which impound water), 20 reservoirs, 29 pumping and generating plants, and approximately 700 miles of aqueducts. Figure 1-1 shows the names and locations of primary water delivery facilities.

Existing long-term SWP water supply contracts call for the annual delivery of up to 4,172,126 acre-feet (af) of Table A water during 2011, gradually increasing to a maximum of 4,172,786 af by 2016. (Annual Table A amounts are shown in Table 1-6 and in Chapter 9, Water Contracts and Deliveries.) Some changes have occurred since the long-term water contracts were signed in the 1960s, including population growth, differences in local water use, local water conservation programs, and conjunctive-use programs. Demands for SWP water are expected to increase as California's population continues to grow. For detailed information about 2011 SWP deliveries, see Chapter 9, Water Contracts and Deliveries.

Project Design

Water from rainfall and snowmelt runoff is stored in SWP conservation facilities and delivered via SWP transportation facilities to water agencies and districts in the Upper Feather River, North Bay, South Bay, San Joaquin, Central Coastal, and Southern California areas.

Three small reservoirs—Antelope Lake, Lake Davis, and Frenchman Lake—are the northernmost SWP facilities. Situated on Feather River tributaries in Plumas County, these lakes are used primarily for recreation. They also provide water to the City of Portola and local agencies that have water rights agreements with DWR.

Downstream from these lakes lies Lake Oroville, which conserves water from the Feather River watershed. Created by Oroville Dam, the tallest earthfill dam in the Western Hemisphere, Lake Oroville is the project's

largest storage facility with a capacity of approximately 3.5 million af.

Releases from Lake Oroville flow down the Feather River into the Sacramento River, which drains the northern portion of California's great Central Valley. The Sacramento River flows into the Sacramento-San Joaquin Delta, comprising 738,000 acres of land interlaced with channels that receive runoff from 40 percent of the State's land area. The SWP, federal Central Valley Project (CVP), and local agencies all divert water from the Delta.

From the northern Delta, Barker Slough Pumping Plant diverts water for delivery to Napa and Solano counties through the North Bay Aqueduct, which was completed in 1988. Near Byron, in the southern Delta, the SWP diverts water into Clifton Court Forebay for delivery south of the Delta. Banks Pumping Plant lifts water from Clifton Court Forebay into the California Aqueduct, which flows to Bethany Reservoir. From Bethany Reservoir, the South Bay Pumping Plant lifts water into the South Bay Aqueduct to supply Alameda and Santa Clara counties. The South Bay Aqueduct provided initial deliveries in 1962 and has been fully operational since 1965.

Most of the water delivered to Bethany Reservoir from Banks Pumping Plant flows into the California Aqueduct. This 444-mile-long main aqueduct conveys water to the agricultural lands of the San Joaquin Valley and to the urban regions of Southern California.

The California Aqueduct winds along the west side of the San Joaquin Valley. It transports water to O'Neill Forebay, Gianelli Pumping-Generating Plant, and San Luis Reservoir. San Luis Reservoir has a storage capacity of more than 2 million af and is jointly owned by DWR and the Bureau of Reclamation (Reclamation). DWR's share of gross storage in the reservoir is 1,062,183 af. Generally, water is pumped into San Luis

Figure 1-1 Names and Locations of Primary Water Delivery Facilities, December 31, 2011

Reservoir from late fall through early spring, where it is temporarily stored for release back to the California Aqueduct to meet summertime peaking demands of SWP and CVP water contractors.

SWP water not stored in San Luis Reservoir and water released from San Luis flows south through the San Luis Canal, a portion of the California Aqueduct jointly owned by DWR and Reclamation.

As the water flows through the San Joaquin Valley, numerous turnouts convey it to farmlands within the service areas of the SWP and CVP. Along its journey, this water is lifted more than 1,000 feet by four pumping plants—Dos Amigos, Buena Vista, Teerink, and Chrisman—before reaching the foot of the Tehachapi Mountains.

In the southern San Joaquin Valley, near Kettleman City, Phase I of the Coastal Branch Aqueduct serves agricultural areas west of the California Aqueduct. In August 1997, completion of Phase II extended the Coastal Branch Aqueduct to serve municipal and industrial water users in San Luis Obispo and Santa Barbara counties.

The remaining water conveyed by the California Aqueduct is delivered to Southern California, home to roughly two-thirds of California's population. Before it can be delivered, the water must first cross the Tehachapi Mountains. Fourteen 80,000-horsepower pumps at Edmonston Pumping Plant, situated at the foot of the mountains, raise the water 1,926 feet—the highest single lift of any pumping plant in the world. The water enters 8.5 miles of tunnels and siphons as it flows into Antelope Valley, where the California Aqueduct divides into two branches: the East Branch and the West Branch.

The East Branch carries water through Alamo Powerplant, Pearblossom Pumping Plant, and Mojave Siphon Powerplant into

Silverwood Lake in the San Bernardino Mountains. From Silverwood Lake, water flows through the San Bernardino Tunnel to Devil Canyon Powerplant. Water continues down the East Branch through the Santa Ana Pipeline to Lake Perris, the southernmost SWP reservoir.

The East Branch Extension is a nearly 33-mile pipeline linking parts of service areas for San Bernardino Valley Municipal Water District and San Geronio Pass Water Agency to the California Aqueduct. The East Branch Extension, Phase I, carries water from Devil Canyon Powerplant Afterbay to Cherry Valley, bringing water to Yucaipa, Calimesa, Beaumont, Banning, and other communities. Phase II, when completed, will assist with this delivery.

Water in the West Branch flows through Oso Pumping Plant, Quail Lake, and then from the Peace Valley Pipeline through Warne Powerplant into Pyramid Lake in Los Angeles County. From there it flows through the Angeles Tunnel, Castaic Powerplant, Elderberry Forebay, and into Castaic Lake, terminus of the West Branch. Castaic Powerplant is operated by the Los Angeles Department of Water and Power.

The energy needed to operate the SWP, the largest single user of electrical power in California, comes from a combination of its own hydroelectric and coal-fired generating plants and power purchased from and exchanged with other utilities. The coal-fired plant and the project's eight hydroelectric power plants, including four pumping-generating plants, produce enough electricity in a normal year to supply about two-thirds of the SWP's necessary operating power.

Tables 1-1 through 1-5 present statistical information about primary storage facilities, primary dams, pumping plants, power plants, and aqueducts.

Table 1-1 Physical Characteristics of Primary Storage Facilities

Facility	Data at Absolute Maximum Elevation

Future Planning and Construction

SWP aqueduct facilities were initially designed and constructed to provide service to all agencies to meet their water delivery needs up to 1990. Project water conservation reservoirs were planned to be constructed in stages as water demands increased. Oroville and San Luis were the first SWP conservation reservoir facilities constructed. Additional facilities were scheduled to meet increased demands. It was anticipated that population

growth in delivery service areas and water supply areas of origin would influence the final schedule for additional SWP facilities. Increasingly, issues such as escalating costs, environmental concerns, and increased non-SWP demands for limited water supplies have become important factors affecting the planning and construction of new facilities.

In response to changes in water management policy, DWR continues to reassess plans for additional facilities that will incorporate increased environmental safeguards while also increasing the SWP delivery yield. Developing these plans involves the time consuming process of finding technically suitable projects and satisfying many complex and dynamic environmental procedures, laws, and regulations.

Climate Change

Planners are also concerned about climate change and its potentially serious effects on water resources. Temperature increases may affect water demand and aquatic ecosystems. Projected increases in air temperature may lead to changes in the amount, timing, and form of precipitation—rain or snow; changes in the volume and timing of runoff; Delta water quality changes due to sea-level rise; and changes in the amount of irrigation water needed due to modified evapotranspiration rates.

The ability of the SWP and CVP to meet the water demands of their customers and the environment depends on the accumulation of mountain snow and subsequent spring and summer snowmelt runoff. A warming climate may reduce this natural water storage mechanism.

To address these concerns, DWR and Reclamation formed a joint Climate Change Work Team to provide qualitative and quantitative assessments of the potential risks and effects of climate change on

Table 1-2 Physical Characteristics of Primary Dams

California's water resources. The team will regularly update decision makers on climate change impacts, the ability of existing facilities to accommodate these impacts, and available mitigation measures.

In response to changes brought about by population growth, environmental concerns, climate change, and other factors, DWR continues to plan, design, and construct transportation and power-producing facilities for the SWP.

For more information about current SWP planning and construction, see Chapter 12, Engineering, Construction, and Real Estate. Information about prior construction activities can be found in previous issues of Bulletin 132.

Methods of Financing

Project facilities have been constructed with several general types of financing: general obligation bonds and tideland oil revenues (under the Burns-Porter Act, which was approved by the Legislature in 1959, and the bond issue approved by voters in 1960); revenue bonds; and capital resources revenues. Repayment of these funds, and the operations, maintenance, power, and replacement costs associated with water supply, are paid by the 29 agencies and districts that have long-term contracts with DWR for the delivery of SWP water.

Long-term Contracting Agencies

From 1963 through 1967, 32 agencies or districts signed long-term water supply contracts with DWR. However, in 1965, the City of West Covina was annexed to The Metropolitan Water District of Southern California, and in 1981, Hacienda Water District was assigned to Tulare Lake Basin Water Storage District. On January 1, 1992, Castaic Lake Water Agency assumed all

rights and obligations granted to Devil's Den Water District in accordance with its long-term water supply contract. Therefore, only 29 agencies and districts have long-term contracts with DWR as of December 31, 2011.

The contracts initially provided for a combined maximum annual Table A amount of 4,230,000 af of water supply. As a result of contract amendments in the 1980s and the Monterey Amendment, the current combined maximum annual Table A amount by 2016 totals 4,172,786 af. The contracts are in effect for the longest of the following periods:

- the project repayment period, which extends to the year 2035;
- 75 years from the date of the contract; or
- the period ending with the latest maturity date of any bond used to finance the construction costs of project facilities.

Figure 1-2 shows the name and location of each contracting agency and district and lists the first year of SWP delivery service for each. Table 1-6 presents more detailed information about each contracting agency.

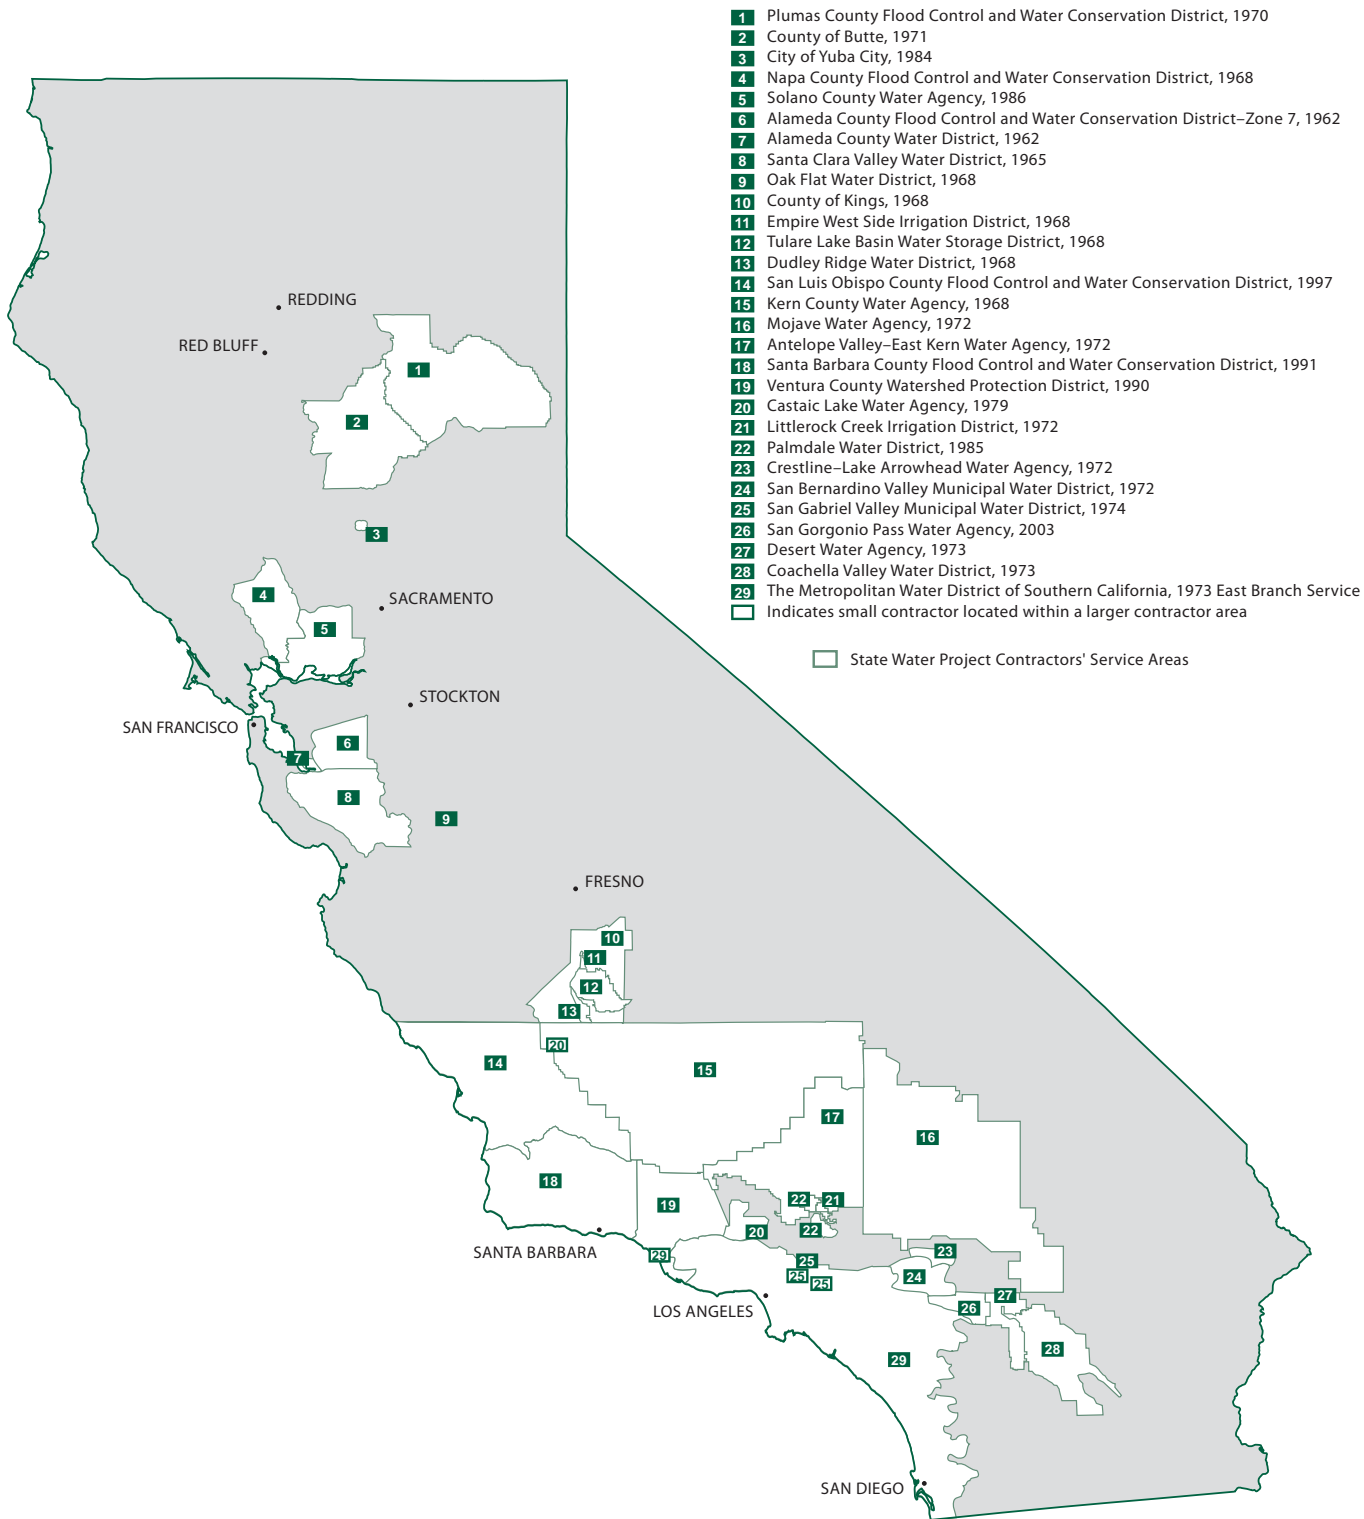

Figure 1-2 Names, Locations, and First Year of Service of Long-term Contracting Agencies, December 31, 2011

^a All water delivered to long-term SWP contractors, including carryover, Article 21, surplus, unscheduled, exchange, permit, purchased, local, and non-SWP water.
^b Statutes of 1978, Chapter 1207, added Section 135 to the Revenue and Taxation Code, requiring assessment at 100% of full value for the 1981–1982 fiscal year and fiscal years thereafter.
^c Total of all Plumas County Flood Control and Water Conservation District, including Last Chance Creek Water District.
^d Assessed valuation not available on an agency area breakdown.
^e Castaic Lake Water Agency (Southern California Area) includes land in the San Joaquin Valley Area formerly known as Devil’s Den Water District.
^f Total for Metropolitan, including Calleguas Municipal Water District, which is common to Metropolitan and Ventura County Watershed Protection District.
^g Includes duplicate values. Some areas that are within two or more agencies are included in each agency’s total.
^h Includes all payments pursuant to the repayment provisions of the Water Supply Contracts. Historic Transportation and Conservation Replacement Accounting System payments are included in this table for the first time and will be included going forward.
ⁱ Formerly Devil’s Den Water District. Castaic Lake Water Agency acquired Devil’s Den Water District’s Table A allocation in 1992.

Chapter 2 Delta Resources

Patterns in the Delta.

Significant Events in 2011

In November 2011, the draft program environmental impact report for the Delta Stewardship Council's *Delta Plan* was released for public review and comment.

The Delta Risk Management Strategy Phase 2 Report was released.

Information for this chapter was contributed by the FloodSAFE Environmental Stewardship and Statewide Resources Office, the Bay-Delta Office, and the Division of Flood Management.

The Sacramento-San Joaquin Delta is a unique environmental resource and a major source of water for millions of Californians. Over the past 40 years, the Department of Water Resources (DWR) and other State and federal agencies have developed and implemented numerous programs to manage the Delta.

DWR's water management programs focus on solving problems in three areas of the Sacramento-San Joaquin Delta: the North Delta, West Delta, and South Delta (see Figure 2-1).

These programs share common goals to:

- improve water supply reliability to the State Water Project (SWP), Central Valley Project (CVP), and Delta water users;
- determine levels of flow and salinity necessary to protect fish and wildlife habitat;
- devise methods to control flooding;
- protect fish and wildlife; and
- provide recreational activities.

Delta Water Management Programs

Future water deliveries to millions of Californians throughout the State will be affected by many factors, including two significant changes: Delta pumping restrictions and climate change.

The CALFED Bay-Delta Program (CALFED) first attempted to address these changes. In 2009, the Delta Stewardship Council (DSC) was established and replaced the function of CALFED (see sidebar, Delta Stewardship Council). In February 2010, DSC assumed the administrative rights, obligations, and duties of the California Bay-Delta Authority. DSC is in the process of developing and implementing a comprehensive Delta Plan based on the Delta Vision (see Bulletin 132-10).

The Bay Delta Conservation Plan (BDCP) is being developed in compliance with the federal Endangered Species Act and the California Natural Community Conservation Planning Act. When complete, the BDCP will provide the basis for the issuance of endangered species permits for the operation of the State and federal water projects. The plan would be implemented over the next 50 years. The heart of the BDCP is a long-term conservation strategy that sets forth actions needed for a healthy Delta.

For more information regarding BDCP, see Chapter 3, Environmental Programs.

The SWP and CVP obtained take authorization for federal Endangered Species Act and California Endangered Species Act listed species for coordinated operations in the Delta through a U.S. Fish and Wildlife Service biological opinion (BO) for Delta Smelt in December 2008, a Department of Fish and Wildlife incidental take permit for Longfin Smelt in February 2009, and a National Marine Fisheries Service (NOAA Fisheries) BO for salmon, steelhead, and Green Sturgeon in June 2009. Some of the requirements in these documents were implemented right away, while other requirements needed development of studies and projects before being implemented. The Bay-Delta Office and Division of Environmental Services have begun developing studies and projects. The operational requirements are being implemented by the Division of Operations and Maintenance. Some of the projects and studies being developed include improving existing fish release sites and identifying two new fish release sites; planning a

Figure 2-1 The North, West, and South Delta as Defined in Public Resources Code Section 29735

Delta Stewardship Council

Created by the Legislature under the Sacramento-San Joaquin Delta Reform Act of 2009 (Delta Reform Act), the Delta Stewardship Council (DSC) is an independent agency of the State of California composed of members who represent different parts of the State and offer diverse expertise in fields such as agriculture, science, the environment, and public service. Of the seven members, four are appointed by the Governor, one each by the Senate and Assembly, and the seventh is the Chair of the Delta Protection Commission. The council is the successor to the California Bay-Delta Authority and assumes all of its administrative rights, abilities, obligations, and duties.

The DSC is mandated by law to develop, adopt, and begin implementing a legally enforceable, comprehensive, long-term management plan for the Sacramento-San Joaquin Delta by January 1, 2012. The *Delta Plan* will establish a set of integrated, legally enforceable policies, strategies, and actions to guide State and local agencies to help achieve coequal goals of providing a more reliable water supply for California and protecting, restoring, and enhancing the Delta ecosystem. It will also guide protection and enhancement of the unique resources, culture, and values of the Delta as an evolving place (California Water Code Section 85054).

The Delta Reform Act also specifies eight policy objectives that are “inherent” in the coequal goals (see Water Code Section 85020); a related statewide policy to reduce reliance on the Delta in meeting the State’s future water supply needs through improved regional water self-reliance (Water Code Section 85021); and certain specific subjects and strategies that must be included in the Delta Plan (see generally, Water Code Sections 85301–85309).

The Delta Reform Act also established the Delta Science Program and Delta Independent Science Board (ISB) to provide the scientific support and oversight the DSC needs to make decisions based on sound science. Members of both are appointed by the DSC. The Delta Science Program replaces the CALFED Science Program, and the Delta ISB replaces the CALFED ISB.

The Delta Science Program will develop scientific information and synthesis on issues critical for managing the Bay-Delta system. That body of knowledge must be unbiased, relevant, authoritative, integrated across State and federal agencies, and communicated to Bay-Delta decision-makers, agency managers, stakeholders, the scientific community, and the public.

The Delta ISB is a standing board of nationally and internationally prominent scientists with appropriate expertise to evaluate the broad range of scientific programs that support adaptive management of the Delta. The Delta ISB will provide oversight of the scientific research, monitoring, and assessment programs that support adaptive management of the Delta through periodic reviews of each of those programs. The overall objective of Delta ISB oversight is to ensure that the science supporting Bay-Delta programs, the application of that science, and the technical aspects of the Bay-Delta programs are optimally developed and implemented.

fishing facility and associated predation study for Clifton Court Forebay; evaluating the screening efficiency of Skinner Fish Facility; and evaluating fish screens at Barker Slough Pumping Plant, Roaring River Slough Distribution System, and diversions around Sherman Island. Also, a fish science building is being planned to hold and rear fish for use in the studies and projects needed to comply with the BOs and incidental take permit.

Delta Plan

The Governor's Delta Vision Blue Ribbon Task Force issued the *Delta Vision Strategic Plan* in November 2008. It outlined strategies for addressing a range of threats facing the Delta and called for the Delta to be managed according to two coequal goals: "Restore the Delta ecosystem and create a more reliable water supply for California."

In 2009, the Legislature and Governor enacted a bill package dealing with water policy and the Delta. Among other things, Senate Bill X7 1 enacted the Sacramento-San Joaquin Delta Reform Act of 2009 (Delta Reform Act). Programs authorized by the act were designed according to the recommendations in the *Delta Vision Strategic Plan*. The Delta Reform Act created two new agencies, the DSC and the Sacramento-San Joaquin Delta Conservancy. The bill also amended key provisions governing the organization and operations of the Delta Protection Commission.

The DSC's mission is to implement the coequal goals of water supply reliability and ecosystem restoration described in the strategic plan. DSC replaces the function of CALFED and assumes all of the administrative rights, abilities, obligations, and duties of the California Bay-Delta Authority. The Delta Reform Act requires the DSC to adopt a comprehensive, long-term management plan for the Delta (*Delta Plan*).

Throughout 2011, the DSC continued to develop the draft *Delta Plan*. From February to August 2011, the DSC released five draft versions of the plan for public review. At each stage of the development of the *Staff Draft Delta Plan* there were public meetings at the DSC meetings for the purpose of receiving information and comments and for DSC deliberation. In addition, public comments were welcome during the entire process and became a formal part of the record. In November 2011, the draft program environmental impact report (EIR) (evaluating the *Fifth Staff Draft Delta Plan*) was released for public review and comment.

For more information regarding the Delta Reform Act, visit the California legislative information website, DSC's website, or the Delta Vision website.

Delta Risk Management Strategy

The overall purpose of the Delta Risk Management Strategy (DRMS) is to complete an evaluation of levee failure risks in the Delta and Suisun Marsh. The Phase 1 report, released in 2009, provided analysis of various risks to levees and the local and statewide consequences of levee failure.

Phase 2 identified and analyzed measures to reduce risks to the Delta and the State from the consequences of levee failure. In 2011, the DRMS project released the Phase 2 report. The Phase 2 report built on the knowledge gained from the DRMS Phase 1 assessment. The information in the report provided insight on methods that may be used by DWR and others to manage risk.

More information about the DRMS is available on DWR's website.

North Delta Program

Since 2003, DWR has evaluated changes in the North Delta's conveyance facilities to improve Delta water quality, fisheries, and water supply reliability, and to improve flood protection and ecosystem health.

North Delta actions include:

- evaluation and implementation of improved operational procedures for the Delta Cross Channel to address fishery and water quality concerns;
- evaluation of a screened through-Delta facility on the Sacramento River of up to 4,000 cubic feet per second (cfs);
- evaluation of flow and salinity in Franks Tract to improve fish protection and improve water quality through installation of operable barriers in the Franks Tract region; and
- design and construction of floodway improvements to provide conveyance, flood control, and ecosystem health (North Delta Flood Control and Ecosystem Restoration Project).

In 2009, work on several projects was suspended as a result of the State's fiscal crisis. The Delta Regional Salmon Outmigration Study, undertaken as part of the Delta Cross Channel evaluations to address fishery and water quality concerns, was not completed. The last phase of the field study and subsequent data analysis were suspended. In 2010, efforts were made to resume analysis of data that were collected in the winter of 2008–2009. U.S. Geological Survey (USGS) staff contracted to conduct the Salmon Outmigration Study were not readily available to do the analysis work in 2010 and 2011. However, it is expected the work will resume in 2012.

Work continued on the environmental impact statement (EIS)/EIR for the Franks Tract Project, which involves installation

of operable barrier(s) in river channel(s) around the Franks Tract region to reduce sea water intrusion and enhance conditions for sensitive fish species. Progress was slowed due to the increased workload from the BOs and incidental take permit and reduced participation from the project's federal partner, the Bureau of Reclamation. However, a sensitivity model analysis was done to assess the benefits of the project under the new BO and incidental take permit for SWP and CVP operations and with or without implementation of the Delta Habitat Conservation and Conveyance Program (DHCCP). Preliminary results showed the Franks Tract Project would benefit water quality even with the DHCCP.

For more information about North Delta Program activities, see Chapter 7, Water Supply Development and Reliability, or DWR's website.

North Delta Flood Control and Ecosystem Restoration Project

The proposed North Delta Flood Control and Ecosystem Restoration Project (NDFCERP) would provide flood control improvements and ecosystem restoration in the North Delta. The project will implement important flood control improvements in the area of the North Delta where the Mokelumne River, Cosumnes River, Dry Creek, and Morrison Creek converge (see Figure 2-2). Flood flows in the area threaten levees, bridges, and roadways when levees on McCormack-Williamson Tract (MWT) are overtopped and a flood surge occurs. The proposed project will help regulate peak flood flows and prevent flood surges. It will also provide substantial aquatic and terrestrial habitat benefits.

The final NDFCERP EIR was certified in November 2010 and recommended the implementation of the preferred alternative (Alternative 1-A for the Group I actions and the No Action Alternative for the Group II actions [see Bulletin 132-11]). The project

Figure 2-2 North Delta Flood Control and Ecosystem Restoration Project, Project Area

will create tidal, subtidal, aquatic, and terrestrial habitats benefiting a number of special status species such as Sacramento Splittail and Chinook Salmon. The project, as proposed, will provide contiguous habitat and a riparian corridor from the downstream portion of the Cosumnes River Preserve to the Delta.

The following project elements are proposed for implementation over a 6-year timeline: the MWT element combines North Delta flood surge reduction measures with the construction of habitat-friendly levees, floodplain restoration, and the creation of freshwater tidal habitat on MWT. The MWT property, purchased using a CALFED grant, is currently owned and managed by The Nature Conservancy. When completed, the MWT element will result in nearly 1,500 acres of tidal marsh and floodplain restoration, consistent with the objectives put forth in the evolving Delta Plan and BDCP. The Grizzly Slough element consists of breaching the Grizzly Slough and Bear Slough levees near MWT to help attenuate peak flood flows and maximize nearly 500 acres of floodplain habitat on the DWR-owned property.

Project Status. Through the CALFED Levee Stability Program, the U.S. Army Corps of Engineers expressed renewed interest in the flood control and ecosystem restoration actions proposed for MWT (a component of the NDFCERP). After the Corps tentatively committed federal funds to evaluate the project for its involvement, DWR and the local reclamation district negotiated an agreement to support project planning with the Corps. The agreement was amended in 2011 to provide additional funds to support the work; and DWR and Reclamation District 2110 awaited notification that the federal agreement was approved in order to complete the Project Implementation Report including the final project design.

For more information on the NDFCERP and the project elements, visit DWR's website.

West Delta Program

The West Delta Program is a part of the Special Investigations Branch in the FloodSAFE Environmental Stewardship and Statewide Resources Office with specific SWP-related objectives that include the following:

- effectively managing SWP-owned lands on Sherman and Twitchell islands (approximately 12,500 acres total);
- improving the integrity of local levees;
- implementing land-use management techniques to control subsidence and soil erosion on Sherman and Twitchell islands; and
- providing diverse habitat for wildlife, especially waterfowl.

DWR is a major landowner on Twitchell and Sherman islands and holds two of the three trustee positions for Reclamation Districts 1601 (Twitchell Island) and 341 (Sherman Island). Consequently, DWR, through the West Delta Program, participates in the management and operation of each district, with the goal of improving conditions and accountability. The reclamation districts provide levee maintenance, island drainage, and some internal water supply. These districts assess the landowners for the operational needs of the public districts.

South Delta Improvements Program

In 1999, the South Delta facilities became a key component of CALFED.

South Delta Improvements Program (SDIP) elements in the CALFED record of decision included increasing diversions through Clifton Court Forebay (first to 8,500 cfs and then to 10,300 cfs), dredging and installing operable tidal barriers in the South Delta, installing a fish barrier at Head of Old River, and constructing the first phase of a new intake and fish screen in Clifton Court

Forebay. SDIP is proposed to be implemented in two component stages.

The SDIP Stage 1 component comprises proposed physical/structural improvements that include constructing and utilizing permanent operable gates, dredging, and modifying agricultural diversions. The SDIP Stage 2 component comprises proposed operational changes to increase water deliveries and improve delivery reliability south of the Delta.

DWR and the Bureau of Reclamation (Reclamation) identified the following SDIP project objectives and purposes:

- reducing movement of San Joaquin River watershed Central Valley fall-run and late fall-run juvenile Chinook Salmon into the South Delta via Old River (SDIP Stage 1);
- maintaining adequate water levels and water quality through improved circulation for agricultural diversions in the South Delta, downstream of Head of Old River (SDIP Stage 1);
- increasing water deliveries and delivery reliability to SWP and CVP water contractors south of the Delta (SDIP Stage 2); and
- providing opportunities to convey water for fish and wildlife purposes by increasing the maximum permitted level of diversion through the existing intake gates at Clifton Court Forebay to 8,500 cfs (SDIP Stage 2).

The SDIP Stage 1 physical/structural component includes the following elements:

- constructing and operating a fish-control gate at Head of Old River to reduce downstream movement of San Joaquin River watershed Central Valley fall-run and late fall-run juvenile Chinook Salmon into the South Delta via the Head of Old River;

- constructing and operating up to three flow-control structures (gates) at Middle River (near the confluence of Middle River with Victoria Canal); Grant Line Canal (near the confluence of Grant Line Canal and Old River); and Old River (just east of the Delta-Mendota Canal intake) to improve existing water level and circulation patterns in South Delta water channels;
- dredging various channels in the South Delta, including Middle and Old rivers, to improve conveyance; and dredging areas surrounding agricultural diversions to improve their function; and
- extending up to 24 agricultural diversion intake facilities to improve their function.

The SDIP final EIR/EIS (2006) determined the preferred alternative for SDIP Stage 1, which entails installation of permanent control gates to replace temporary structures currently installed and removed each year under the DWR Temporary Barriers Project. The preferred alternative also includes the elements of dredging and extending agricultural diversions.

Preferred Plan

The preferred plan for SDIP is to construct the physical/structural component as soon as permits are obtained and defer the operational component until more is known about the project's potential effects on the Delta Smelt and other protected fish species.

DWR deferred the increase in diversions of up to 10,300 cfs and the associated new fish screens as components of the SDIP due to major funding issues as well as significant technical uncertainties associated with the design and construction of the new fish screens.

Program Status

DWR and Reclamation continued to suspend most SDIP planning and permitting activities during 2011. Some activities were

undertaken to address requirements of the 2009 NOAA Fisheries BO for the CVP and SWP Long-term Operations Criteria and Plan.

Discussions between DWR and NOAA Fisheries revealed NOAA Fisheries' concern for potential barrier hydraulic disturbances which could promote increased predation on juvenile salmon. DWR conducted a hydrodynamic study focusing on barrier design features to minimize these disturbances. A study report was submitted to NOAA Fisheries in April 2010, which identified several features that could be incorporated into the design.

NOAA Fisheries stated an interest to hold off further discussions on the SDIP until completion of an on-going multiyear South Delta Temporary Barriers Project predation study. The study is being conducted to satisfy requirements of the 2008 NOAA Fisheries BO for the project and is examining the occurrence of predation associated with the project. The study's field data collection was completed in 2011. Data from the study will be useful in considering permanent barrier design options and operation strategies to minimize predation.

For additional information about SDIP, see Chapter 7, Water Supply Development and Reliability.

Temporary Barriers Project Facilities

The South Delta Temporary Barriers Project is an ongoing project that installs up to four rock barriers in channels located in the southern portion of the Sacramento-San Joaquin Delta near the cities of Tracy and Lathrop in San Joaquin County. The barriers are installed during the irrigation season from April to November at four sites (see Figure 2-3), as follows:

- (1) Head of Old River, in Old River where it splits from the San Joaquin River (rock barrier was not installed in 2011);
- (2) Old River near Tracy, one-half mile east of the Jones Pumping Plant intake and about 8 miles northwest of Tracy;
- (3) Middle River near Victoria Canal, just south of the confluence of Middle River, Trapper Slough, and North Canal; and
- (4) Grant Line Canal, 420 feet east of the Tracy Boulevard Bridge.

The Old River near Tracy, Middle River near Victoria Canal, and Grant Line Canal rock barriers are designed to act as flow control structures to improve water levels and circulation within the South Delta. The Head of Old River barrier is designed to improve migration conditions for Central Valley fall-run Chinook Salmon in the spring and fall. In the spring, the barrier blocks juvenile salmon migratory movements into Old River from the mainstream San Joaquin River. In the fall, the barrier increases the volume of San Joaquin River flow passing downstream through the Port of Stockton and improves dissolved oxygen levels in the San Joaquin River. As a result, it improves the low dissolved oxygen sag that occurs near that area and aids adult salmon upstream migration in the San Joaquin River basin.

In 2011, the three agricultural barriers at Middle River near Victoria Canal, Grant Line Canal, and Old River near Tracy were installed and operated as planned. However, due to a 2008 court order (Wanger Decision) to protect Delta Smelt, installation of the spring Head of Old River physical rock barrier was prohibited. In 2009 and 2010, in lieu of a rock barrier, DWR installed a nonphysical barrier comprised of sound projectors, strobe lights, and a bubble curtain. This combination of technology is referred to as a bioacoustic fish fence. In 2011, DWR planned to install a newly designed bioacoustic fish fence. The fence was constructed and ready to install, but high discharge on the San Joaquin River precluded installation. An acoustic telemetry system was installed and used to track movements of salmon smolts, steelhead, and predatory fish. This was done

Figure 2-3 Temporary Barrier Locations in the South Delta

in coordination with the larger telemetry studies being conducted by Reclamation and the U.S. Fish and Wildlife Service. Detailed information on route survival and fish behavior in the absence of a barrier was collected and analyzed.

In 2011, DWR continued the fish study data collection at all four barrier sites without the installation of the Head of Old River barrier. The other three agricultural barriers were installed and operated as usual. Data associated with this project will be combined in a single comprehensive report.

The fall Head of Old River barrier was not installed in 2011 because the existing flows and dissolved oxygen levels in the San Joaquin River were sufficient for Chinook Salmon, and it was not requested by the Department of Fish and Wildlife.

More information on the temporary barriers can be found on DWR’s website.

Delta Flood Control

Many important assets in the Sacramento-San Joaquin Delta are protected from flooding by levees. The levees serve many needs. They protect valuable wildlife habitat, farms, homes, urban areas, recreational developments, highways, railroads, natural gas infrastructure, utility lines, a major aqueduct, and other public developments. Some levees are critical to the protection of in-Delta water quality and water quality for approximately 25 million Californians who receive a portion of their water from the Delta. The State Legislature recognized the importance of the Delta and enacted the Delta Flood Protection Act of 1988 (Senate Bill 34 [Water Code Sections 12300 et seq. and 12980 et seq.]). With Senate Bill 34, the Legislature declared that “. . . the Delta is

endowed with many invaluable and unique resources and that these resources are of major statewide significance.”

Since 1988, the Delta Levees Program has provided more than \$310 million in State-appropriated funds. These monies, combined with local cost-share funding, have realized more than \$385 million in levee improvements (through State fiscal year 2010–2011).

In Senate Bill 34, the Legislature declared its intent to appropriate \$12 million annually for the Delta Flood Protection Fund. Of this appropriation, \$6 million is for local assistance under the Delta Levee Maintenance Subventions Program. The remaining \$6 million is for the Delta Levees Special Flood Control Projects, including subsidence studies and monitoring on Bethel, Bradford, Jersey, Sherman, and Twitchell islands; Holland, Hotchkiss, and Webb tracts; and the towns of Thornton and Walnut Grove.

In 1996, Assembly Bill 360 was signed into law expanding the area covered by the Delta Levees Program to include the remainder of the legal Delta and northern Suisun Bay.

Bond appropriations of \$25 million from Proposition 204 (enacted in 1996) and \$30 million from Proposition 13 (enacted in 2000) provided supplemental funding.

In November 2002, Proposition 50 was approved. It provided \$70 million in additional funding to implement the Delta Flood Protection Program as adopted in CALFED, where the program was known as the Levee System Integrity Program.

Proposition 84, approved by voters in November 2006, allocated \$275 million to the Delta for 4 years.

Proposition 1E, also approved by voters in November 2006, added funding for Delta levee improvements.

CALFED Levee Stability Program

The CALFED Bay-Delta Authorization Act (Public Law 108-361, 2004) authorized the Corps to develop action strategies to address urgent levee improvement needs and identify and prioritize potential short-term and long-term levee stability projects in the Delta.

The CALFED Levee Stability Program is the Corps’ short-term strategy to move quickly on high-priority levee reconstruction projects.

The Corps’ long-term strategy for Delta levees will be developed in the Sacramento-San Joaquin Delta Islands and Levees Feasibility Study. The feasibility study will build on recommendations in the State’s Delta Risk Management Strategy, a technical study to assess the risks to the Delta levee system and the associated effects of levee failures.

For additional background information, see Bulletin 132-11.

Delta Flood Emergency Preparedness, Response, and Recovery Program

The Delta Flood Emergency Preparedness, Response, and Recovery Program is a part of the FloodSAFE California Initiative. The FloodSAFE initiative was developed by DWR in response to the passing of the Disaster Preparedness and Flood Prevention Bond Act of 2006 (Proposition 1E), which made funding available to enhance disaster preparedness. The program is designed to enhance emergency preparedness and enable DWR to better coordinate with its local partners to respond to and recover from a large-scale Delta flood emergency.

The Flood Operations Branch received an initial draft of the *Delta Flood Emergency Preparedness, Response, and Recovery Plan* in November. The Plan supports established statewide emergency planning documents and procedures and includes prescribed actions for dealing with flood emergencies within the Sacramento-San Joaquin Delta.

For more information, visit DWR's website.

Delta Levees Maintenance Subventions Program

The Delta Levees Maintenance Subventions Program (Subventions Program) is a cost share program that provides technical and financial assistance to local levee-maintaining agencies in the Sacramento-San Joaquin Delta for the maintenance and rehabilitation of Delta levees. The Subventions Program is authorized by California Water Code Sections 12980 through 12995 and is managed by DWR. The Central Valley Flood Protection Board reviews and approves DWR's recommendations and enters into agreements with local agencies to reimburse eligible costs for levee maintenance and rehabilitation.

The Subventions Program provides funding to local levee-maintaining agencies for improving, maintaining, and enhancing nearly 700 miles of project and nonproject levees. Since its inception in 1973, the Subventions Program has provided more than \$160 million of State funding to more than 70 islands in the Sacramento-San Joaquin Delta. In fiscal year 2011–2012, the program reimbursed nearly \$8 million to 67 local agencies for eligible levee maintenance and rehabilitation activities. These activities helped minimize the risk of Delta levee failure which in turn protects the Delta's ecosystem, communities, and agriculture; State and private infrastructure; and the State's water supply.

Delta Special Flood Control Projects Program

The Delta Special Flood Control Projects Program assists the eight western islands, portions of the Suisun Marsh, the towns of Thornton and Walnut Grove, and other locations in the Delta with flood protection and levee stability repairs. The California Water Commission approved a report of initial actions in September 1989, and it approved long-term actions and priorities in May 1990. The long-term actions and priorities serve as a guide for DWR to determine the best use of appropriations to protect these islands. Long-term actions and priorities include the following:

- rehabilitating threatened levees through the beneficial reuse of dredged material;
- verifying elevations in the Delta through the use of global positioning system equipment and light detection and ranging;
- upgrading levees to the standards included in Bulletin 192-82 (Delta Levees Investigation); and
- considering projects to achieve net long-term habitat improvement for fish and wildlife.

While DWR seeks cost sharing for all projects, the actual reimbursement depends on each reclamation district's ability to pay. DWR may provide up to 100 percent of the cost. Districts receiving these funds are required to participate in a habitat improvement program to ensure net long-term habitat enhancement.

Levee restoration projects, habitat projects, and other special projects were conducted on various Delta islands and tracts in 2011.

Reuse of Dredged Material for Delta Levees

As local sources of fill material for levee repair are depleted, new economical

sources must be located. DWR has worked to find more opportunities to reuse clean, dredged materials in the Sacramento-San Joaquin Delta.

As part of this effort, a charter for the multiagency Delta Long-Term Management Strategy (LTMS) for the beneficial reuse of dredged material became effective in February 2007. The LTMS is designed to improve operational efficiency and coordination of collective and individual agency decision-making responsibilities, resulting in approved dredging and dredged material management actions in the Delta. Regular LTMS meetings include representatives from DWR, the Corps, the U.S. Environmental Protection Agency, the Regional Water Quality Control Board (RWQCB), the Ports of Stockton and West Sacramento, and other interested parties. LTMS is evaluating potential beneficial reuse opportunities, particularly from the proposed Sacramento and Stockton Deep Water Ship Channel projects, and has prepared a draft summary of Delta dredged material placement sites and a draft Delta-wide map of existing sediment placement sites.

To facilitate the permitting process for dredging and dredged material placement and reuse, a draft joint permit application for dredging and dredged material placement/reuse has been developed. An interagency agreement between DWR and the RWQCB is underway; a sediment background study is planned for Sherman, Twitchell, and Brannan-Andrus islands; and development of general order waste discharge requirements to help streamline the RWQCB's approval process has also been initiated.

Delta LTMS long-term goals include the following:

- developing a streamlined permitting process for dredging and dredged material reuse;
- developing a consolidated guidance document addressing sampling, tests, protocols, and methods for assessing sediment and dredged material characterization;
- developing a sediment management plan of methodologies for assessing and characterizing sediments and determining appropriate disposal options;
- developing a programmatic biological assessment for sensitive Delta species;
- drafting a programmatic EIR/EIS for the Delta LTMS; and
- identifying and permitting additional sediment placement and beneficial reuse sites in the Delta.

For more information, visit DWR's website.

Subsidence Investigations

Subsidence in the Sacramento-San Joaquin Delta marshlands is widely accepted to be caused by local draining and cultivation projects, which cause the peat soil to break down and compact. The peat soil has oxidized and subsided since the mid-1800s when the land was first drained and levees constructed. The surface of organic soils in the Delta is now between 10 and 29 feet below sea level. The Legislature recognized the problem and, with the initiation of the Delta Flood Protection Act of 1988, DWR began monitoring subsidence and studying its causes and the means for reversing its effects. The West Delta Program has been given the specific task of implementing land-use management techniques to control subsidence and soil erosion on Sherman and Twitchell islands, where the SWP owns approximately 12,500 acres of land.

DWR continued its partnership with USGS for research on the 15-acre Twitchell Wetlands Research Facility, initially funded in 1999 using CALFED Category III funds. Additional research activities performed in 2011 by USGS include assessments of water quality impacts, greenhouse gas release, factors

influencing the formation of methylmercury, and other impacts of tule cultivation in subsided Delta islands.

Because of the success of this wetland site, there have been plans to expand the project in size, creating a farm-scale wetland between 300 and 1,000 acres on Twitchell Island. Further development of a proposed Farm Scale Wetlands Demonstration Project adjacent to the existing Subsidence Reversal Demonstration Project occurred in 2011 to determine the land accretion and carbon sequestration rates associated with wetland farming within the western Delta.

The Mayberry Farms Subsidence Reversal and Carbon Sequestration Project was officially underway when it was flooded in 2011. The Mayberry Farms project created permanently flooded wetlands on a 307-acre parcel on Sherman Island. The completion of construction restored approximately 192 acres of emergent wetlands and enhanced approximately 115 acres of seasonally flooded wetlands. The Mayberry Farms project is a demonstration project that will provide subsidence reversal benefits and develop knowledge that can be used by operators of private wetlands, including "duck clubs," which manage lands for waterfowl-based recreation. The plan is to maintain permanent water to stimulate the growth and subsequent decomposition of emergent vegetation, which will control and reverse subsidence. The project is anticipated to provide climate benefits by sequestering atmospheric carbon dioxide and provide several research opportunities with greenhouse gas production and sequestration; methylmercury production; and general hydraulic, hydrologic, or water quality projects. One such research project began in 2011 involving the study of water quality and the formation of methylmercury in the wetland. The methylmercury research on Mayberry Farms is a joint effort between West Delta staff and Department of Fish and Wildlife water quality scientists from

the Moss Landing laboratory. The parcel is expected to provide year-round wetland habitat for waterfowl and other wildlife.

In addition to tules, rice is a wetland crop with an existing agricultural market that has the potential to accrete land mass and sequester carbon. The Subsidence Mitigation Rice Cultivation Research project continued to determine whether growing rice reverses subsidence, whether it can be grown without deleterious effects to the environment, and whether rice is economically feasible in the Delta.

In April 2011, 304 acres of rice were planted on Twitchell Island. Research data from 2009–2010 collected by consultants (University of California (UC), Davis and USGS) showed rice production (approximately 304 acres) stopped subsidence and achieved small amounts of accretion, sequestered atmospheric carbon dioxide, and acted as a sink for methylmercury.

Because of the findings from the research, and to potentially make the rice fields more productive and economical for a future lease, a western expansion of the rice fields was constructed in 2011. With the expansion of this project, the additional 281 acres of rice producing fields will further contribute to carbon dioxide sequestering and subsidence reversal on Twitchell Island. Planting is scheduled again for spring 2012, with approximately 585 acres of rice production planned.

Work continued in 2011 on a greenhouse gas protocol, which is a collaborative effort between DWR, the State Water Contractors, the California Air Resources Board, the Delta Conservancy, and several research organizations, including UC Berkeley. The West Delta Program worked with UC Berkeley researchers to construct three towers that measure greenhouse gas fluxes at Mayberry Farms and the corn and rice

fields on Twitchell Island. The towers will collect data that will be analyzed by DWR and used to develop future protocols.

DWR continued to work with the Delta Science Program (formerly the CALFED Science Program) to develop best management practices to control and reverse subsidence and will work with local districts and landowners to implement cost-effective measures.

For current information related to these projects, please visit DWR's website.

Delta Agricultural Water Agencies

In 1974, the Delta Water Agency was replaced by six Delta agricultural water agencies: North Delta Water Agency, South Delta Water Agency, Central Delta Water Agency, Contra Costa County Water Agency, East Contra Costa Irrigation District, and Byron-Bethany Irrigation District. In 1981, North Delta Water Agency and East Contra Costa Irrigation District signed water rights management contracts with DWR. DWR negotiated contracts and requested negotiations with other agencies to provide water level, circulation, and quality needs in certain areas.

South Delta Water Agency Contract

In September 1990, DWR completed negotiations for a long-term agreement with South Delta Water Agency and Reclamation. Under the South Delta Water Agency contract, the parties agreed to proceed with the design, construction, and operation of certain barrier facilities in the South Delta channels. These facilities resolved portions of the lawsuit that South Delta Water Agency filed in 1982 regarding the alleged effects of export pumping by the SWP and CVP on water levels, quality, and circulation in the South Delta.

DWR has installed and operated temporary barrier facilities in the South Delta to improve area conditions, as well as collect data needed to design and operate permanent barrier facilities. Ongoing efforts are being made to improve water levels, circulation, and quality in South Delta channels. These efforts have included modifying and dredging around local diverters' intakes, conducting a series of computer modeling studies, and modifying barrier flap gate operations.

Although DWR received the required environmental permits to raise the Middle River weir by 1 foot, the weir was not raised because of adequate water levels and quality. (Water year 2010–2011 was a wet year.)

Western Delta Municipal Water Users

DWR signed contracts with Contra Costa Water District in 1967 and the City of Antioch in 1968. These contracts compensate Contra Costa and Antioch for purchasing water of usable quality when such water is not available from Mallard Slough and the San Joaquin River.

According to the contract, DWR compensates each agency for the additional costs of purchasing a substitute water supply from the Contra Costa Canal. This water is purchased to replace water supplies of usable quality which are lost due to SWP operations. Credits for the number of days of above-average water supplies of usable quality, from Mallard Slough and the San Joaquin River, accrue to offset the number of below-average days in future years.

Chapter 3

Environmental Programs

California Red-legged Frog, Rana draytonii.

Significant Events in 2011

In 2011, the *Vernalis Adaptive Management Plan* (VAMP) marked its twelfth and final year of formal compliance with State Water Resources Control Board, Water Right Decision 1641. Actions associated with VAMP were implemented between May 1 and May 31, 2011.

Pursuant to the Fish Restoration Program Agreement, the Department of Water Resources (DWR) and the Department of Fish and Wildlife (DFW) began developing a strategy for implementing restoration actions to satisfy DWR's obligations under the biological opinions (BOs) and incidental take permit. A draft was distributed to stakeholders for public review in fall 2011.

The *Climate Change Handbook for Regional Water Planning* was released in December 2011. The handbook provides resources and tools to guide water resource managers and planners as they develop ways to adapt their programs to a changing climate. The handbook was developed cooperatively by the Department of Water Resources (DWR), U.S. Environmental Protection Agency, Resources Legacy Fund, and U.S. Army Corps of Engineers. The handbook is available from DWR's website.

Information in this chapter was contributed by the Division of Environmental Services, the Division of Operations and Maintenance, the Division of Integrated Regional Water Management, and the State Water Project Analysis Office.

The Department of Water Resources (DWR) has developed and implemented several programs to avoid, minimize, and/or offset adverse environmental impacts resulting from construction and operation of State Water Project (SWP) facilities.

Operations for Species of Concern

A primary consideration in the operation of the SWP is avoiding, minimizing, and/or offsetting adverse impacts to species of concern, species listed as threatened or endangered by a State or federal agency, or species proposed for listing. The SWP is operated pursuant to biological opinions (BOs) issued under the federal Endangered Species Act (ESA), as well as consistency determinations or incidental take permits issued under the California Endangered Species Act (CESA). A key to avoiding and minimizing adverse impacts to these species is maintaining flexibility in SWP operations. Operational responses can include Delta Cross Channel gate closure, export curtailments, changes in delivery schedules, increased reservoir releases, preferential use of certain facilities, or a combination of these actions.

Additional information can be found in Chapter 7, Water Supply Development and Reliability.

San Joaquin River Activities *Vernalis Adaptive Management Plan*

The *Vernalis Adaptive Management Plan* (VAMP) was initiated in 2000 as part of State Water Resources Control Board, Water Right Decision 1641. VAMP is a large-scale, long-term (12-year), experimental management program designed to protect juvenile Chinook Salmon (*Oncorhynchus tshawytscha*) migrating from the San Joaquin River through the Sacramento-San Joaquin Delta (Delta). The goal of VAMP is to conduct operational changes and associated fisheries

studies to determine if a relationship exists between river flow, Delta exports, and salmon survival throughout the southern Delta. VAMP's study results will be used to determine if changing San Joaquin River flows and Delta exports in the spring can significantly benefit San Joaquin River fall-run Chinook Salmon.

DWR, the Bureau of Reclamation (Reclamation), and the San Joaquin River Group Authority member agencies coordinate SWP and Central Valley Project (CVP) operations to increase flows in the San Joaquin River during the specified VAMP pulse flow period, a 31-day period during the months of April and May, to benefit fall-run Chinook Salmon emigrating from the San Joaquin River Basin. Intensive fisheries sampling is conducted in the lower San Joaquin River during the pulse flow period. VAMP studies coordinate variable export pumping rates with a fish release and tracking study to estimate the relative survival of marked salmon moving through the Delta under VAMP during the pulse flow period. A temporary rock barrier is installed at the Head of Old River to block the movement of juvenile salmon into Old River, allowing them to continue down the main stem of the San Joaquin River.

In 2011, VAMP marked its twelfth and final year of formal compliance with State Water Resources Control Board, Water Right Decision 1641. Actions associated with VAMP were implemented between May 1 and May 31, 2011.

Because San Joaquin River basin flows were driven by flood-control operations during the 2011 VAMP period, the VAMP hydrologic

operation consisted mainly of monitoring the flow conditions during the VAMP period.

The mean daily flow in the San Joaquin River at the Vernalis gauge averaged 12,650 cubic feet per second (cfs) during the VAMP target flow period. The mean daily flow at Vernalis varied between 10,100 cfs and 18,200 cfs during the target flow period.

The combined CVP and SWP Delta export rate target during the VAMP period was 3,000 cfs. The observed exports during this period averaged 3,360 cfs and ranged from 2,420 cfs to 5,160 cfs.

The fish release and tracking study was conducted; however, flows in 2011 were too high to install either a physical or nonphysical barrier at the Head of Old River.

Temporary Barriers

VAMP-participating agencies install temporary barriers in the San Joaquin River to provide an adequate water supply for South Delta water diverters, improve water quality in the Stockton Deep Water Ship Channel, and prevent entrainment of juvenile Chinook Salmon at the South Delta facilities.

Brief background information about the temporary barriers and a map showing their locations can be found in Chapter 2, Delta Resources.

Head of Old River Barrier. The planned spring Head of Old River nonphysical barrier was not installed this season due to high flows in the San Joaquin River as a result of late-season storm activity and associated heavy snowpack. As a result, fish studies at the Head of Old River were restructured to evaluate predatory fish behavior in the absence of a nonphysical barrier. All equipment was removed on June 23, 2011.

The fall Head of Old River barrier was not installed per Department of Fish and Wildlife (DFW) instruction.

For additional information, see Chapter 2, Delta Resources.

Agricultural Barriers—Old River near Tracy, Middle River, and Grant Line Canal.

Installation of the Old River near Tracy barrier started on May 27, 2011, and closure was achieved June 10, 2011.

Middle River barrier construction started on June 1, 2011, and the barrier was closed June 6, 2011. All culvert flap gates at both barriers were tied open.

In compliance with the temporary barriers permit and agreement condition, the Middle River and Old River near Tracy barriers were notched on September 15, 2011. A 10-foot notch was created at each barrier to allow salmon passage. All culvert flap gates at the Old River near Tracy and Middle River barriers were untied on August 23; the barriers were breached on October 11, 2011.

Installation of the Grant Line Canal barrier started on June 10, 2011, and included reconstruction of the south abutment and culvert structures. Work was completed on June 24, 2011.

Closure of the Grant Line Canal barrier was nearly complete on July 14; however, high river flows caused erosion and damaged the existing flashboard structure near the south levee. To relieve pressure on the barrier and prevent scour, larger rocks were placed at the southern barrier abutment and the weir was lowered; this work was completed August 3, 2011.

The installation of the six 48-inch culverts was completed with the placement of the catwalk. All the flap gates were secured in the tied-open position.

No notch was required at the Grant Line Canal barrier this season due to high river flow.

As of August 12, 2011, all culvert flap gates at Old River near Tracy, Middle River, and Grant Line Canal remained tied open.

Removal of the barriers at Old River near Tracy and Middle River was completed on October 31 and October 18, respectively.

The Grant Line Canal barrier removal began the week of October 17, 2011, and was completed November 4. Due to high San Joaquin river flows, the reinstallation of the damaged flashboard structure at the barrier was postponed until the following spring.

San Joaquin River Restoration Program

In 2006, the San Joaquin River Restoration Program (SJRRP) was established to implement the court settlement to restore 153 miles of the San Joaquin River from Friant Dam to the confluence of the Merced River. The agencies responsible for the implementation of SJRRP include Reclamation, the U.S. Fish and Wildlife Service (USFWS), National Marine Fisheries Service (NOAA Fisheries), DWR, and DFW. On March 30, 2009, the San Joaquin River Restoration Settlement Act was signed into law, authorizing and funding the SJRRP.

The SJRRP continued to make progress on program activities in 2011. The draft program environmental impact statement (EIS)/environmental impact report (EIR) was released for public review on April 22, 2011, with the comment period ending June 21, 2011. After a number of requests to extend the comment period, it was extended for 90 days with a new closing date of September 21, 2011. Public hearings were held May 24–26, 2011, in Visalia, Fresno, Los Banos, and Sacramento.

The second year of interim flows was completed and included the recapture of more than 29,600 acre-feet of flows that were recirculated to Friant Division long-term contractors. Planning, design,

and environmental compliance activities continued in support of the Mendota Pool Bypass and Reach 2B Channel Improvements Project and the Reach 4B, Eastside Bypass and Mariposa Bypass Channel and Structural Improvements Project.

In September, the SJRRP was selected as one of 17 recipients for the 2011 Partners in Conservation Award from the U.S. Department of the Interior for its extensive collaborative efforts.

More information is available on SJRRP's website.

Lower Yuba River Accord

The Lower Yuba River Accord's (Yuba Accord) purpose is to resolve instream flow issues and protect and enhance lower Yuba River fisheries and local water supply reliability. The Yuba Accord provides revenues for local flood control and water supply projects, water to enhance SWP and CVP water supply reliability by offsetting Delta export reductions for protection and restoration of Delta fisheries, and improvements in statewide water supply management, including dry year supplies for participating SWP and CVP contractors.

In 2011, excess conditions in the Delta prevented accounting of Yuba County Water Agency releases as transfer water for the entire summer transfer season. Yuba County Water Agency must repay Component 1 water in a future year that is not a dry or critical year, will not reduce Component 2 or 3 deliveries, and is agreeable in schedule to the parties. The effects of the BOs on allocations and transfer timing make that repayment more difficult than was envisioned when the Water Purchase Agreement was negotiated.

For more information about the Yuba Accord, see Chapter 9, Water Contracts and Deliveries.

Oroville Facilities

Existing Federal Energy Regulatory Commission License Activities for 2011

Invasive Plant Management

During 2011, DWR worked with DFW, Butte County Resource Conservation District, the California Conservation Corps, and the Butte County Agricultural Commissioner to control and remove red sesbania (*Sesbania punicea*) in Butte County. A two-year grant was acquired in 2010 by the Butte County Weed Management Area. The grant funding supported treatment of a good portion of red sesbania along the upper reach of the Feather River and within the Oroville Wildlife Area. DWR has been annually removing all red sesbania along the Thermalito Power Canal, Thermalito Forebay, and Thermalito Diversion Pool. This ongoing maintenance was started by the Department of Parks and Recreation (California State Parks) in 2007. DWR took over in 2008 and will continue until red sesbania is eradicated. The Thermalito Power Canal, Forebay, and Diversion Pool are the upstream extent of the red sesbania population on the Feather River.

Also in 2011, DWR partnered with the Butte County Agricultural Commissioner to treat skeleton weed (*Chondrilla juncea*) near McCabe Creek at Lake Oroville. DWR provided California Conservation Corps labor to clear access for Butte County to treat the skeleton weed.

Lake Oroville Fisheries

In January 2011, DWR purchased 320,000 Coho Salmon eggs from Aquaseed Corporation in Washington (80,000 experimental triploid [sterilized] eggs and 240,000 diploid [standard] eggs). The eggs were hatched at the Feather River Fish Hatchery (FRFH). A total of 229,400 Coho Salmon were planted in the lake (212,400 mixed-sex fish and 17,000 sterile fish).

During 2011, DFW stocked 5,000 steelhead in the Thermalito Afterbay due to a surplus egg supply at the FRFH.

Habitat improvement continued in 2011 in the fluctuation zone of the lake. Approximately 1,800 Christmas trees were recycled with the help of the Boy Scouts and the California Conservation Corps. The trees were constructed into structures for juvenile fish habitat in the Miners Ranch saddle dam area.

Feather River Fish Hatchery

A total of 10,544,230 juvenile fall-run Chinook Salmon were released into the Delta, the Sacramento River, and the San Francisco and San Pablo bays in 2011.

Also in 2011, a total of 2,227,846 juvenile spring-run Chinook Salmon were released: 1,156,133 in San Pablo Bay and 1,181,710 in the Feather River. Additionally, 33,800 steelhead were planted in the Feather River at Boyd's Pump.

Oroville Wildlife Area

Construction activities for two new wetland ponds in the Oroville Wildlife Area began in August 2010, and were completed in November 2011. Approximately 250,000 cubic yards of material were removed. The wetland ponds will convert a 20-acre area of low-quality, disturbed, upland habitat (flat, open area, with sand/cobble soils and heavily vegetated with weedy annuals and other nonnative plants) into 10 acres of emergent wetland and 10 acres of riparian habitat. Revegetation efforts and nonnative plant species management are anticipated to begin in spring 2012. These wetland ponds are being created as mitigation required by the 1995 federal Clean Water Act Section 404 permit for two waterfowl brood ponds that were constructed at the Thermalito Afterbay. The brood ponds were a requirement of the revised recreation plan that was part of the

Federal Energy Regulatory Commission's September 22, 1994, order.

Lake Oroville Elevation

The 2011 low point for the Lake Oroville reservoir elevation was reached on January 1 at 800.3 feet, and the annual high point of 900.1 feet was reached on June 25. The full pool elevation of Lake Oroville is approximately 900 feet.

Federal Energy Regulatory Commission Relicensing Activities

Various conservation measures for the species identified in the USFWS 2007 BO for the Oroville Facilities relicensing project continued to be implemented on SWP lands. Monitoring associated with these measures includes an annual vernal pool survey (645 mapped vernal pools and/or features); protective measures for elderberry shrubs (*Sambucus* species, host plant for the valley elderberry longhorn beetle [*Desmocerus californicus dimorphus*]); and annual monitoring of nesting Bald Eagles (*Haliaeetus leucocephalus*) in the area (four currently active nests). In addition, habitat management activities within the Oroville Wildlife Area are coordinated through DFW staff. These activities include providing nest and forage habitat for waterfowl and upland bird species, monitoring and maintaining Thermalito Afterbay brood pond water surface elevations, and protecting and conserving Giant Garter Snake (*Thamnophis gigas*) habitat. An annual compliance report for 2011 was compiled by DWR and submitted to USFWS.

For more information about Oroville Facilities relicensing, see Chapter 10, Power Resources.

Invasive Species

Quagga and Zebra Mussel Monitoring and Assessment

The quagga mussel, *Dreissena rostriformis bugensis*, and the zebra mussel, *D. polymorpha*, are invasive freshwater mussels that pose a significant threat to the SWP. Both species attach to hard substrates, including other mussels, with strong byssal threads, forming dense colonies and causing significant biofouling impacts to raw water infrastructure by clogging small diameter piping and filters and encrusting trash racks and fish screens.

In early 2007, the quagga mussel was detected in the lower Colorado River and spread throughout connected water diversion systems (see Bulletin 132-08). The following year, the zebra mussel was detected in San Justo Reservoir in San Benito County, adding to the existing threat. In response, DWR formed the Aquatic Nuisance Species (ANS) Program within the Division of Operations and Maintenance (O&M). The program includes applied studies, early detection monitoring, vector management, rapid response planning, long-term mussel management, and public outreach.

Applied Studies

Assessment of Habitat Suitability. DWR's consultant, RNT Consulting Inc. (see Bulletin 132-11), examined the suitability of the SWP to support long-term populations of quagga and zebra mussels (dreissenids) if unintentionally introduced. Ten years of calcium and pH data were analyzed from 23 SWP water quality stations. Calcium and pH are essential in shell formation and survival of dreissenid mussels. Based on the results, locations in the SWP were classified into one of 3 groups: unable to support, potentially able to support, or able to support long-term populations of dreissenid mussels. Understanding where dreissenid mussels may survive in the SWP will be

used to prioritize management efforts. The report, *Examination of Calcium and pH as Predictors of Dreissenid Mussel Survival in the California State Water Project*, is available on DWR's website.

To verify the determination, RNT Consulting Inc. tested mussel survival in SWP waters with different levels of calcium. During July through October 2011, water was periodically trucked from three locations to holding tanks at San Justo Reservoir. The locations were the Sacramento River at Hood, Clifton Court Forebay, and O'Neill Forebay Outlet/Check 13, representing low to moderate suitability waters (see Figure 3-1). Water from San Justo Reservoir served as the control. Mussels were held in each water type for 12.5 weeks and were examined for shell condition, weight loss, and mortality. During the fourth week of the study, calcium levels increased at all locations due to lowered reservoir releases, thus improving the suitability characteristics of the water and compromising the results of the study. Study results are anticipated to be available in 2012.

Development of Control Methods.

RNT Consulting Inc. conducted two studies to evaluate low pH as a potential control tool for mussels. Low pH is known to inhibit calcium uptake resulting in impaired veliger (the free floating larval stage) development, degradation of adult mussel shells, and increased mortality. Results of the first pH study showed that the settlement of veligers was inhibited with decreasing pH. At a pH of 7.0, the lowest pH level examined, veliger settlement was about 90 percent lower compared to settlement in the control group. The second study tested the effect of very low pH on adult mussel survival. Results showed 100 percent mortality at pH 3.0, 70 percent mortality at pH 2.0, and 50 percent mortality at pH 4.0.

Early Detection Monitoring. DWR routinely monitors the California Aqueduct, SWP reservoirs, and the Sacramento-San Joaquin

Delta for the presence of quagga and zebra mussels. DWR uses three different methods to monitor for mussels: zooplankton tows (with DNA analysis) for veligers; settlement plates (see Bulletin 132-10); and bioboxes for adults (attached/settled stage).

In 2011, DWR and two collaborating water agencies, Santa Clara Valley Water District and The Metropolitan Water District of Southern California, collected veliger samples at 16 locations (see Bulletin 132-10). In addition, DWR staff are trained in quagga and zebra mussel identification, and are instructed to look for mussels during regular field work and during routine facility maintenance activities. No mussels were detected in the SWP, the Delta, or other SWP source water during 2011.

Prevention and Response Planning

To protect and prepare the SWP against mussels, ANS Program staff developed several planning documents to guide actions and identify vulnerabilities. The *Quagga and Zebra Mussel Vector Management Plan for the State Water Project* identifies potential mussel points-of-entry and vectors, and outlines mechanisms to reduce the risk of introduction. The two primary vectors of mussels are downstream transport of planktonic veligers in natural and constructed waterways and overland transport of veligers and attached adults on watercraft. A critical component of the vector management plan is reducing the risk posed by watercraft. To accomplish this, DWR contracted with the California State Parks and the Los Angeles County Department of Parks and Recreation (LA County Parks) to implement vessel inspection and outreach programs at SWP reservoirs determined to be at moderate- to high-risk for quagga/ zebra mussel infestation (located in Zones 2 and 3) that were not already covered by an existing inspection program. These included San Luis State Recreation Area (San Luis Reservoir, O'Neill Forebay, and Los Banos Creek Reservoir) and Pyramid and Castaic

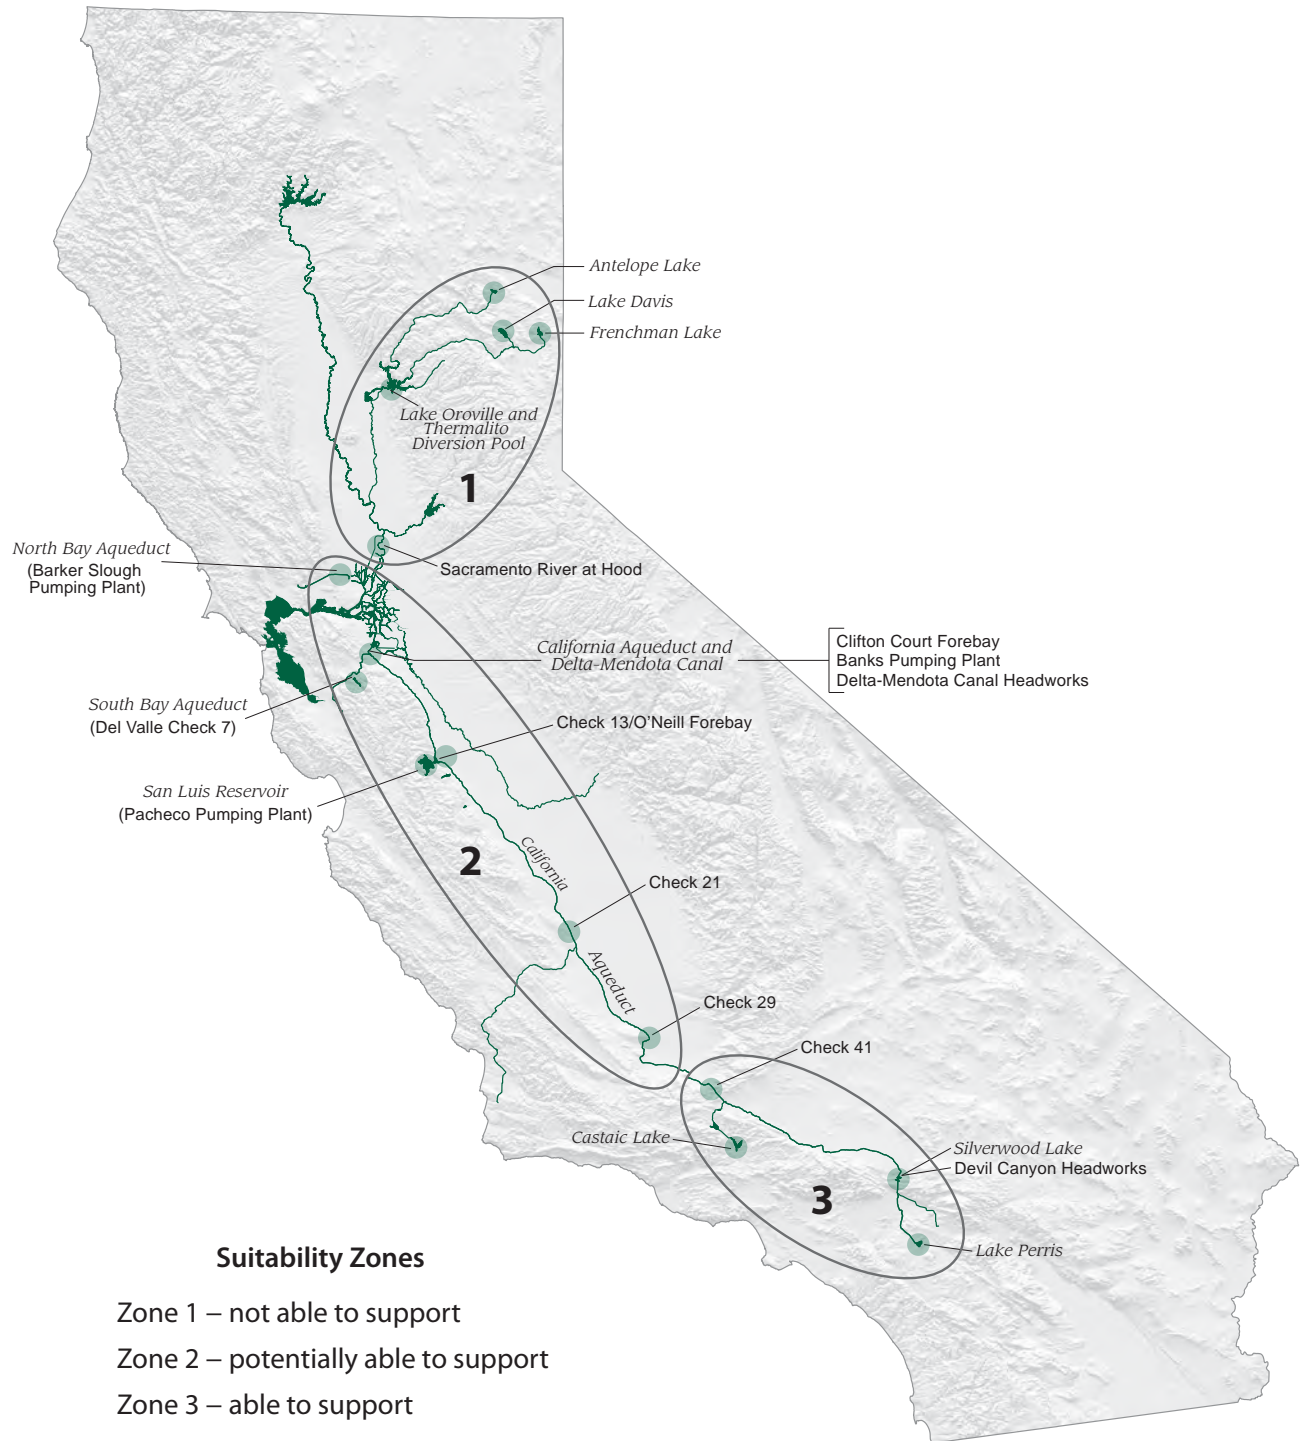

Figure 3-1 Quagga/Zebra Mussel Habitat Suitability in the SWP based on Calcium and pH

lakes. The San Luis State Recreation Area program is operated by California State Parks and was fully implemented in October 2011. The program at Pyramid and Castaic lakes is operated by LA County Parks and was phased in from July to November with full implementation in December 2011. The contracts will continue for 3-year terms.

In the event mussels are detected in the SWP, the *Quagga and Zebra Mussel Rapid Response Plan for the State Water Project* outlines a course of action to confirm the sighting, delineate the population, implement containment and eradication measures, and notify State and federal partner agencies, the SWP water contractors, and any potentially impacted entities.

With uncontrolled watercraft access to and from infested bodies of water, such as the Colorado River, the SWP and the Delta remain vulnerable to mussel infestation. Therefore, DWR is preparing a long-term mussel management plan that identifies facility vulnerabilities and outlines both short-term and long-term options to prevent or mitigate mussel biofouling impacts for all at-risk SWP facilities. The short-term control strategies are those that can be implemented within a few weeks to a few months time and may be temporary in nature, such as shutdowns for power washing and shell removal. The long-term control strategies have longer implementation times (6 months to multiple years) and are permanent in nature (alterations to infrastructure).

RNT Consulting Inc. is assisting DWR with plan preparation. The first phase of the project focused on Southern Field Division facilities, as RNT Consulting Inc. determined that all facilities located downstream of Check 41 are at the highest risk of mussel establishment. RNT Consulting Inc. and DWR ANS Program staff conducted facility site visits, focusing on raw water infrastructure, and determined the areas vulnerable to mussel biofouling. The report is scheduled

for completion in 2012. Similar reports will be prepared for the Delta, San Luis, and San Joaquin field divisions.

The Bay Delta Conservation Plan

In 2011, State and federal agencies continued collaboration and analysis toward drafting the Bay Delta Conservation Plan (BDCP) and the corresponding EIR/EIS documents and agreed to release preliminary drafts of key BDCP-related documents to the public before the formal public review scheduled for 2012. Other highlights of this process for 2011 included refinements to habitat conservation measures proposed by the BDCP, developing alternatives for water conveyance facilities, creating comprehensive biological goals and objectives for covered fish species, and scientific review of the BDCP effects analysis draft.

Refinements to BDCP Conservation Measures

The Yolo Bypass Fishery Enhancement Planning Team significantly advanced development of the Yolo Bypass Fishery Enhancement conservation measure in 2011. Several objectives were developed to help salmon and other fish species. Some of the actions in the newly developed conservation measure include improving the timing, frequency, and duration of flows in the Yolo Bypass, adding fish ladders, making flood control structures more fish friendly, and realigning the mouth of Putah Creek.

The South Delta Habitat Working Group examined several approaches to fish migration habitat and flood management improvement corridors in 2011, identifying specific flood control and habitat projects with the highest potential benefits. Based on these findings, potential floodplain habitat was identified as compatible with flood management objectives. Work is ongoing to quantify flood benefits and risk transfer, and

to identify positive and negative ecological effects corresponding with these projects.

Range of Alternatives

In 2011, a range of alternatives for water conveyance facilities in the BDCP were developed. The alternatives differ primarily in the location, design, size, and operation of water conveyance facilities, as well as habitat restoration options.

Biological Goals Developed

The Biological Goals and Objectives Working Group developed comprehensive goals and objectives for fish species including Chinook Salmon, Delta Smelt, Longfin Smelt, Pacific and River Lamprey, Sacramento Splittail, White Sturgeon, and Green Sturgeon in 2011. These include scientific data, habitat restoration best management practices, and life history rationale supporting each goal and objective. Also included is an overview of how the conservation strategy, if implemented, will help attain each goal and objective; and, when applicable, specific numeric goals for each life stage of each species.

Effects Analysis Reviewed

Because the BDCP will alter the physical and biological environment of the Delta, it includes an effects analysis to describe predicted effects on biological performance, particularly with regard to species' population levels. It is a systematic, scientific look at both potential impacts and potential benefits from conservation actions. In 2011, an independent science review panel, convened by the Delta Stewardship Council, conducted Phase I of their assessment of the draft Effects Analysis.

More information is available on the Delta Stewardship Council's website.

BDCP EIR/EIS

A combined EIR/EIS is currently underway, which will fulfill requirements under the California Environmental Quality Act (CEQA) and National Environmental Policy Act (NEPA). DWR is the State lead agency and Reclamation, USFWS, and NOAA Fisheries are the federal co-lead agencies. Certain chapters of the EIR/EIS were released to federal and State agencies for their review in late 2011. This joint document reviews the environmental effects of the proposed BDCP and a reasonable range of alternatives, including a "no action" alternative. This evaluation will help determine the ultimate preferred alternative and final plan. The lead agencies will continue evaluation of options that include a pipeline/tunnel as well as options to restore up to 100,000 acres of tidal habitat. These options will undergo screening and analysis for comparison. The EIR/EIS will evaluate the potential impacts of the BDCP including impacts to local communities, cultural resources, and the physical and biological environment.

Environmental Surveys

DWR continued conducting field surveys as part of an ongoing effort, begun in 2009, to collect environmental data. These field surveys included botanical as well as wildlife surveys. An environmental document report was prepared summarizing survey work for the 2011 survey season.

Geotechnical Monitoring

DWR's geotechnical monitoring continued in 2011. Specifically, DWR conducted geotechnical borings on properties owned by DWR and on properties whose owners expressed permission to enter in the summer and fall of 2011 to obtain information associated with the BDCP and preliminary engineering studies for the proposed conveyance facilities.

Biological Opinions Issued on CVP/SWP Operations

NOAA Fisheries and USFWS have issued BOs on CVP and SWP operations that include reasonable and prudent alternatives (RPAs) to avoid jeopardy of federally listed species. Both BOs have been remanded by federal court, and in December 2011, USFWS was informed of Reclamation's intent to initiate a combined NEPA process with USFWS and NOAA Fisheries to update the BOs, evaluate the RPAs, and answer specific questions asked by the court.

USFWS Biological Opinion

The 2008 USFWS BO was remanded based on federal court findings that although fish entrainment at the pumping facilities will adversely affect Delta Smelt, the science supporting flow prescriptions in the BO was questioned, and the economic and technical feasibility of the RPAs was not considered. The court set a deadline for development of a new Delta Smelt BO, RPAs, and NEPA review by Reclamation to be completed by December 1, 2013.

A February 2011 settlement agreement bridged an agreement for interim operations of the SWP and CVP through June 30, 2011,

Endangered Species and Biological Opinions

An endangered species is one in danger of extinction in all or a significant portion of its range; a threatened species is one likely to become endangered. The Endangered Species Act (ESA) and the California Endangered Species Act (CESA) are designed to protect threatened and endangered species by ensuring federal and State agencies adopt measures to protect the species during the design, construction, and operation of projects, or for other forms of agency action, and prohibit the unauthorized take of endangered species. Biological opinions and incidental take permits are issued to protect ESA- and CESA-listed species.

ESA Section 7 requires federal agencies to ensure that any action they authorize, fund, or carry out is not likely to jeopardize the continued existence of listed species or modify their critical habitat, otherwise formal consultation is required. Federal agencies must consult with the U.S. Fish and Wildlife Service and/or the National Marine Fisheries Service (the wildlife agencies). As part of the consultation process, the wildlife agency issues a biological opinion which states the agency's determination of whether the action is likely to jeopardize a species or adversely modify critical habitat. If the wildlife agency determines an action will jeopardize or adversely modify, it will suggest reasonable and prudent alternatives that the "action agency" may take to avoid the likely jeopardy or adverse modification (Title 16, United States Code Sections 1531–1544 [1973]).

CESA is substantially similar to ESA in all aspects (California Fish and Game Code Sections 2050–2098 [1984]). Under CESA, an incidental take permit issued by the Department of Fish and Wildlife can allow for the take of State-listed species if specific criteria are met, including measures to minimize and mitigate the impacts of authorized take (California Code of Regulations, Title 14, Sections 783.0–783.8).

to limit Delta Smelt entrainment. The interim remedy set a 14-day average for Old River and Middle River flow as a range between -1,250 cfs and -6,100 cfs. The agreement called for an enhanced coordination and transparency process for the Smelt Working Group (SWG), a team of interagency experts on Delta Smelt and Longfin Smelt biology. The SWG was to determine optimal Old River and Middle River flows within the -1,250 cfs to -6,100 cfs range. Their determination would be based upon best available science, including real-time data of overall Delta Smelt distribution, turbidity, salvage, incidental take, temperature, and other relevant physical and biological factors.

In September 2011, the federal court issued an injunction against the full implementation of the RPA Component 3, Action 4 (the “Fall X2 Action”). The RPA pertains to flow levels during fall months that locate the low salinity zone downstream of the Sacramento River confluence where habitat conditions are more favorable. Even with the injunction, flow conditions in 2011 resulted in the fall X2 location being very close to the RPA standard. During this time, the Interagency Ecological Program (IEP) commissioned studies to investigate the effects of fall habitat on the Delta Smelt population.

NOAA Fisheries Biological Opinion

In April 2011, NOAA Fisheries amended the 2009 BO RPAs based on the recommendations of a 2010 independent science review hosted by the Delta Stewardship Council. Updates to the RPAs included improvements to real-time operations and data collection, as well as clarification of specific actions.

In July 2011, a subcontractor with Ocean Associates, Inc., Kier Associates, submitted the final report titled, “An Alternative Technique to Quantify the Incidental Take of Listed Anadromous Fishes at the Federal and State Water Export Facilities in the San Francisco Bay-Delta Estuary.” Reclamation

and DWR set forth a plan in December 2011 to evaluate the alternative technique presented in the report and planned to present a recommendation on the best technique to quantify incidental take of listed anadromous fish species to the independent science review for consideration and refinement.

In September 2011, a federal court upheld the jeopardy conclusion of the 2009 NOAA Fisheries BO, but found that RPAs were not adequately justified or supported by the record. The court directed a remand of the BO. In December 2011, the court ordered that a new BO be finalized by February 2016.

Delta Operations for Delta Smelt and Longfin Smelt

The SWG generally meets from December through June to assess the risk to Delta Smelt and Longfin Smelt from CVP and SWP export facilities. Based on near real-time technical information, such as fish distribution and salvage and physical water conditions, the SWG makes recommendations on export operations with the goal of reducing entrainment of the two species.

Recommendations are based on guidelines outlined in the 2008 USFWS BO and the 2009 DFW Longfin Smelt incidental take permit (see Bulletin 132-11).

During the 2010–2011 water year, strong Delta outflow resulted in more positive flow conditions in the Old River and Middle River channels, posing a low risk for Delta Smelt and Longfin Smelt entrainment. The SWG made no recommendations to modify water project operations.

Neither Delta Smelt nor Longfin Smelt were salvaged at the SWP facility in 2011. At the CVP facility, 51 Delta Smelt and 4 Longfin Smelt were salvaged. These were extremely low values, equaling or surpassing the lowest observed since 1981.

Fish Restoration Program

Pursuant to the Fish Restoration Program Agreement, DWR and DFW began developing a strategy for implementing restoration actions to satisfy DWR’s obligations under the BOs and incidental take permit (see Bulletin 132-11). The implementation strategy is being developed in coordination with USFWS, NOAA Fisheries, and Reclamation, and a draft was distributed to stakeholders for public review in fall 2011. The purpose of this implementation strategy is to describe the process by which DWR and DFW will implement the Fish Restoration Program (FRP) and develop an implementation schedule that will identify restoration actions, estimated costs, targeted acreage, and a timeline for the program. The FRP implementation strategy is expected to be finalized in 2012.

The Fish Restoration Program Agreement Amendment 1, signed on November 15, 2010, clarified details regarding funding for the Battle Creek Restoration Project, one of the proposed actions in the agreement. In December 2010, DWR received confirmation from NOAA Fisheries that the transfer of funds to the Battle Creek Restoration Project would fully satisfy DWR’s obligation under BO Action 1.2.6 (restore Battle Creek for winter- and spring-run Chinook Salmon and Central Valley steelhead). The first \$5.3 million was provided to DFW in June 2011.

Also in 2011, the FRP put out a request for proposals to hire a consulting company to aid in restoration modeling, design, and permitting work. Initial efforts in 2011 focused on habitat restoration of Prospect Island, a property acquired by DWR in 2010. Tasks early in the restoration planning and design process have begun, such as identifying data gaps and working on a stakeholder outreach plan.

The FRP continues to try to find a mechanism to establish a plan for Prospect Island property management, maintenance, and ongoing and emergency levee maintenance. Attempts to reactivate Reclamation District 1667 have not progressed due to numerous issues. The FRP continues to work with other units within DWR to have the levees mowed and inspected.

Decisions on Endangered Species

Table 3-1 lists fish species of concern found in the Delta. No status decisions were made in 2011.

Longfin Smelt

On February 2, 2011, the USFWS agreed to conduct a rangewide status review of Longfin Smelt, and to consider whether any population of Longfin smelt qualifies as a distinct population segment. The publication of the 12-month finding is expected in 2012.

Table 3-1 Special Status Delta Fish Species

Common Name	Scientific Name	ESA (date listed)	CESA (date listed)
Delta Smelt	<i>Hypomesus transpacificus</i>	threatened (4/5/1993)	endangered (1/20/2010)
Longfin Smelt	<i>Spirinchus thaleichthys</i>	none	threatened (4/9/2010)
Chinook Salmon (winter-run)	<i>Oncorhynchus tshawytscha</i>	endangered (2/3/1994)	endangered (9/22/1989)
Chinook Salmon (spring-run)	<i>Oncorhynchus tshawytscha</i>	threatened (11/15/1999)	threatened (2/5/1999)
Chinook Salmon (fall/late fall-run) steelhead (Central Valley DPS)	<i>Oncorhynchus tshawytscha</i>	species of concern (4/15/2004)	none
	<i>Oncorhynchus mykiss</i>	threatened (5/18/1998)	none
Green Sturgeon (Southern DPS)	<i>Acipenser medirostris</i>	threatened (6/6/2006)	none

ESA = federal Endangered Species Act; CESA = California Endangered Species Act; DPS = distinct population segment

Trends in Fish Abundance

Abundance indices for Longfin Smelt and Delta Smelt are based on DFW fall midwater trawl sampling conducted every year from September through December. Index calculations are based on average catch per trawl for 100 core index stations, which are partitioned into 14 geographic areas. The average monthly catch per tow in each area is multiplied by a weighting factor that is based on the estimated volume of water in each area. The resulting values are then summed over all areas and months to obtain the annual index. This fall abundance index provides one of the best indicators of the status of the adult Longfin and Delta Smelt populations.

The abundance index for Longfin Smelt, from 1967 through 2011, is shown on Figure 3-2.

Figure 3-3 shows the abundance index for Delta Smelt, from 1967 through 2011. The index rose significantly in 2011, to a value nearly 12 times higher than in 2010. This was the highest observed index for Delta Smelt in a decade.

For more about the declining abundance of Delta Smelt and other pelagic fish species in the Delta, see the Pelagic Organism Decline section in this chapter.

Figure 3-4 shows estimates of returning adult winter-run Chinook Salmon from 1970 through 2011. These estimates, referred to as escapement estimates, are the number of adults that escape mortality and return to spawn. The Sacramento River winter-run Chinook Salmon escapement estimates are generated using data from the DFW carcass survey. DFW has been using the carcass survey data to generate escapement estimates since 2001, prior to which Red

Figure 3-2 Longfin Smelt Fall Midwater Trawl Abundance Index, 1967–2011

Figure 3-3 Delta Smelt Fall Midwater Trawl Abundance Index, 1967–2011

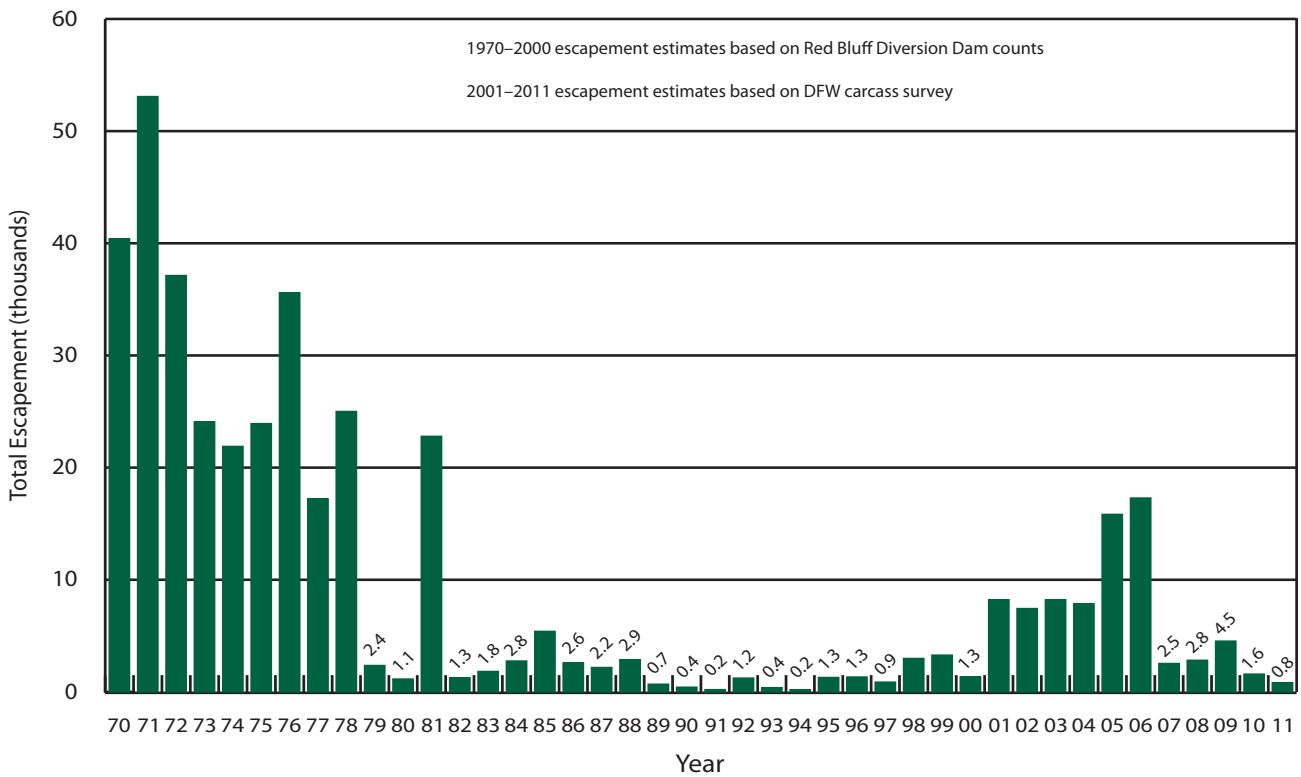

Figure 3-4 Estimated Total Adult Winter-run Chinook Salmon Escapement, 1970–2011

Bluff Diversion Dam counts were used. The estimated winter-run Chinook Salmon escapement for 2011 was 827, which was a 48 percent decrease from 2009 and the lowest estimate since 2000.

Figure 3-5 shows estimates of returning adult spring-run Chinook Salmon from 1985 through 2011. Individual estimates are shown for FRFH and the principal spring-run spawning streams: Mill Creek, Deer Creek, and Butte Creek. The escapement estimates are shown separately for each stream, because the Feather River estimate is based on returns to the FRFH, where the genetic integrity of spring-run Chinook Salmon is uncertain. The estimated escapement for 2011 was 1,969 for FRFH and 2,767 for the other streams combined. The 2011 FRFH escapement was approximately 121 percent of the 2008 parent stock escapement estimate. The escapement of naturally spawned fish for Mill, Deer, and Butte

creeks was about 62 percent of the 2008 parent stock.

Due to the lack of comprehensive monitoring programs, there are no reliable escapement estimates for wild Central Valley steelhead.

Pelagic Organism Decline in the Upper San Francisco Estuary

By the early 2000s, long-term monitoring by the IEP revealed marked declines in numerous pelagic (open water) fish species in the upper San Francisco Estuary (the Delta and Suisun Bay). This decline has collectively become known as pelagic organism decline (POD).

Abundance indices calculated from several IEP monitoring programs for pelagic fish of the upper estuary increased in 2011

Figure 3-5 Estimated Total Adult Spring-run Chinook Salmon Escapement, 1985–2011

over the prior year, but generally remained similar to the very low levels observed over the last decade. Pelagic fish species in decline include Delta Smelt, Longfin Smelt, Striped Bass, and Threadfin Shad. These declines have had significant management consequences, including limits on pumping operations for the protection of Delta Smelt (listed as threatened under ESA and endangered under CESA) and Longfin Smelt (listed as threatened under CESA).

Since 2005, IEP scientists have been coordinating studies investigating potential causes of POD. In 2010, they prepared a synthesis of major results from research investigating the effects of ecosystem and environmental drivers on declining species (*IEP Pelagic Organism Decline Work Plan and Synthesis of Results* is available on DWR's website). In this synthesis, a new conceptual model was put forward, hypothesizing that POD was caused by changes to multiple and interacting environmental variables, such as outflow, turbidity, and salinity, which led to fundamental changes in both physical aspects and community composition of the Delta ecosystem. This "ecosystem regime shift" conceptual model has been used to explain dramatic shifts in other aquatic systems and will serve as a working hypothesis for future POD investigations. In 2011, studies focused on examining POD species in relation to the ecosystem regime shift model. In addition, at the end of 2011, the IEP recommended the formation of the IEP Management, Analysis, and Synthesis Team to synthesize scientific datasets with the goal of addressing pressing management information needs. Delta Smelt will be a major focus of the team's efforts.

Feather River Fish Studies

In the early 1990s, Feather River fish studies were initiated to document and monitor fish populations in the lower Feather River. Early efforts focused on studies to identify flow requirements for Chinook Salmon

and steelhead. The Feather River Program progressively expanded since it was established in the mid-1990s to prepare for the Federal Energy Regulatory Commission relicensing process associated with the Oroville Facilities. Field program elements have expanded to include operation of rotary screw traps (RSTs), acoustic and radio telemetry, salmon and steelhead spawning surveys, salmon escapement surveys, spring-run Chinook Salmon tagging, otolith thermal marking studies, snorkel surveys, Green Sturgeon studies, and steelhead passive integrated transponder (PIT) tagging.

The study area is generally divided into the low-flow channel, from the Fish Barrier Dam downstream to the Thermalito Afterbay Outlet, and the high-flow channel, from the Thermalito Afterbay Outlet downstream to the confluence with the Sacramento River at Verona (Figure 3-6).

Rotary Screw Traps

RSTs capture juvenile salmon and steelhead as they emigrate from the Feather River. Over the last 14 years, DWR has used RSTs as the primary method to assess the general abundance and timing of emigrating juvenile salmon and steelhead in the lower Feather River. In addition, large numbers of naturally produced salmon have been coded wire tagged (CWT) in an effort to examine their return success. This long-term monitoring yields valuable baseline information about juvenile salmonid production in the lower Feather River and the effects of project operations on abundance and migration timing.

Emigration timing and speed measurements confirm that most naturally produced juvenile Chinook Salmon move rapidly through the upper reaches of the lower Feather River. Consistent with select years of trapping data, turbidity may influence the emigration timing of naturally produced juvenile salmon. However, other studies

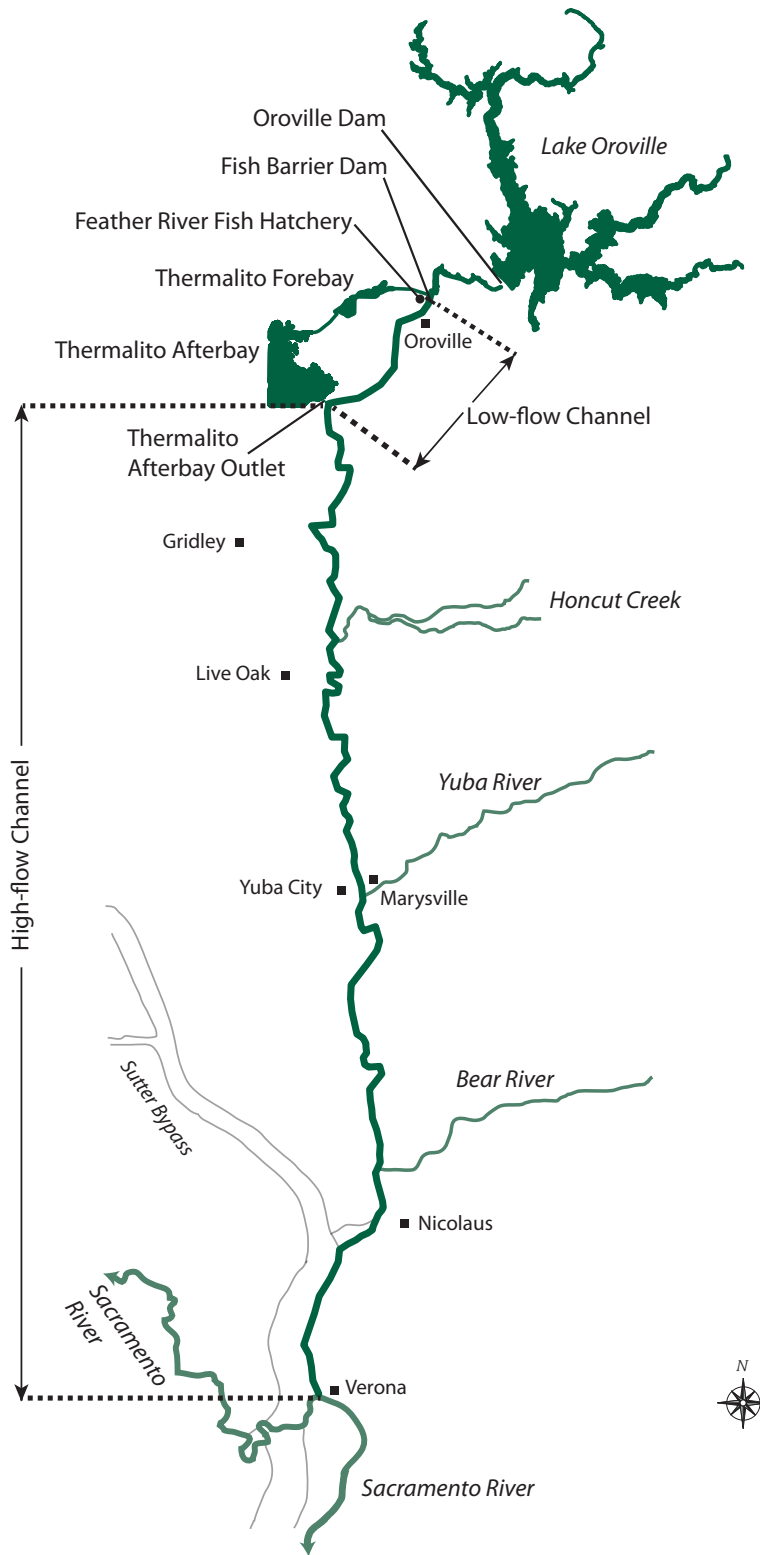

Figure 3-6 The Lower Feather River

demonstrate that the timing of adult spawning plays a large role in determining juvenile salmon emigration patterns as well.

The 2011 season was fished throughout the emigration period (December through August). Two RST locations were used to assess the timing and general abundance of juvenile Chinook Salmon, steelhead, and other fishes emigrating in the lower Feather River. Within the low-flow channel, one RST (Steep Riffle) was stationed at River Mile (RM) 61, approximately 2 miles above Thermalito Afterbay Outlet. Within the high-flow channel, two RSTs were fished in tandem below Sunset Pumps at RM 38 from the beginning of December 2010 through June 2011. The Steep Riffle location provided a passage estimate of 12,289,580 juveniles, and the Sunset Pumps location estimate was 8,576,905 juveniles.

Although Chinook Salmon and steelhead were the primary targets of trapping efforts, records were kept on all fish species caught. Twenty-nine species were caught during the 2011 season. Chinook Salmon was the dominant species, comprising 99 percent of the catch. Of the total salmon catch during the 2011 trapping season, 1,746,619 were caught in the low-flow channel and 100,590 were caught in the high-flow channel.

In 2011, juvenile CWT salmon were used to analyze timing, survival, and trap efficiency. Based on RST efficiency estimates, it was calculated that 12,450 CWT salmon passed by the recapture point during the 2011 study period.

The emigration time over the 21-mile reach from the Thermalito Afterbay Outlet to Sunset Pumps varied significantly among release groups, taking an average of 5.1 ± 1.9 days. The average speed of the recaptured salmon fry was approximately 8.0 ± 1.7 miles per day.

In 2011, there was no significant relationship between either timing or speed of emigration and the physical characteristics of the river at the time of CWT fish release.

The mean survival index for the CWT release groups (over the 21-mile river reach) was 0.12 ± 0.02 . Emigration timing and speed measurements confirmed that most naturally produced Chinook Salmon move through the upper reaches of the high-flow channel rapidly.

Acoustic and Radio Telemetry

Acoustic and radio telemetry gathers baseline information on the migration and holding patterns of adult Chinook Salmon in the lower Feather River. A telemetry study was conducted to collect additional data to evaluate the relationship between water temperature and migration patterns of prespawning adult Chinook Salmon.

Chinook Salmon with a spring-run life history enter freshwater in early summer and hold in the river up to several months before spawning. In order to collect additional data to evaluate water temperature and migration patterns of prespawning adult Chinook Salmon, spring-run adult Chinook Salmon are captured and tagged with radio tags or acoustic tags to document their habitat use. Because the water temperature regime associated with the ongoing operation of the Oroville Facilities may expose prespawning adult Chinook Salmon to elevated water temperatures during the migration and holding period, radio and acoustic tagging was implemented to determine whether the pools downstream of the Thermalito Afterbay Outlet provide water temperatures suitable for holding.

Between May 31 and June 23, 2011, 23 adult Chinook Salmon designated as having spring-run life history traits were captured using hook-and-line sampling (angling) and implanted with acoustic tags. These fish were monitored along the 67-mile stretch of river

from the Fish Barrier Dam near the FRFH to the confluence with the Sacramento River at Verona. Thirty submersible hydrophone receivers positioned at various locations picked up the signals from the implanted tags as the fish passed the receivers. Mobile tracking was performed approximately once a week from June through November using an ultrasonic receiver mounted in a boat. Fixed station receivers were checked at least once per month during the survey season. All 23 (100 percent) of the tagged fish were subsequently detected. Movement of fish was observed through October.

Due to low numbers of fish returning to the FRFH in June, an attempt was made to attract additional adult spring-run Chinook Salmon for hatchery broodstock purposes by increasing flows in the low-flow channel and simultaneously decreasing flows in the high-flow channel. The 2011 spring-run telemetry study data was used to determine whether pulse flows in the low-flow channel have a positive effect on upstream migration.

The pulse flow was conducted from June 20–25, 2011, with an increase from 700 cfs to 2,600 cfs in the low-flow channel and a decrease from 10,000 cfs to 6,100 cfs in the high-flow channel.

Two (8.7 percent) of the fish showed no upstream movement and were last detected 1 mile below their respective tagging locations, one below Sunset Pumps (RM 38) and one below the Thermalito Afterbay Outlet (RM 59). Two other fish were last detected near the FRFH at the end of June, one of which was recovered in the hatchery during spawning.

Of the 23 acoustic-tagged fish, 14 were used in the pulse-flow analysis. Ten (71 percent) showed a positive upstream response that coincided with the pulse flows.

Spawning Surveys

To better understand Feather River salmon and steelhead spawning characteristics, redd surveys are performed to determine abundance and distribution and identify the location, timing, magnitude, and physical characteristics of natural spawning sites in the lower Feather River. The surveys are generally performed weekly, and most of the available spawning area between the Fish Barrier Dam and Honcut Creek is searched.

Salmon

The 2011 Chinook Salmon redd survey began on September 11 and continued through November 13. During the eight weekly surveys, 1,592 mature redds were found within the spawning area between Table Mountain Riffle (RM 66.9) and the Thermalito Afterbay Outlet (RM 59) in the low-flow channel. Another 264 redds were discovered in the high-flow channel from the Thermalito Afterbay Outlet to the Gridley Bridge.

The week 4 survey (October 9 to October 11) covering the low-flow channel identified the highest number of redds with 751. The second highest total was 336 redds for the survey conducted September 25 and 26 covering the area from Table Mountain Riffle (RM 66.9) to Eye Riffle (RM 60.2). The location with the largest number of redds was the Auditorium Riffle area with 573 (36 percent). Trailer Park Riffle was next at 168 (11 percent). The uppermost 3-mile section of the river between the Fish Barrier Dam and Trailer Park Riffle contained 81 percent of the Chinook Salmon redds in the low-flow channel and high-flow channel.

Steelhead

In 2011, a total of 26 steelhead redds were identified during the eight weekly surveys. Steelhead redds were first observed on January 3 (survey week 1) with newly constructed redds continuously observed through February 23 (survey week 8).

Steelhead redd construction was consistent through the first 6 weeks of the sampling period with three to five new redds observed per week. No newly constructed steelhead redds were observed during survey weeks 7 and 8.

During the 2011 sampling period, 100 percent of the steelhead redds were located in the low-flow channel and 92.3 percent were within 1 mile of the Fish Barrier Dam. This pattern is generally consistent with past steelhead redd surveys and affirms preference for upstream spawning distribution.

Salmon Escapement Survey

The purpose of the salmon escapement survey is to evaluate the abundance, distribution, and timing of Chinook Salmon adults spawning in the river.

The survey provides information crucial to monitoring, managing, and conserving the Feather River's salmon populations. The data are used to identify trends in population and age structure, track patterns in spawning distribution, determine proportions of hatchery versus wild fish, and explore environmental effects on salmon survival rates. Estimating the number of salmon returning to spawn is the basic goal of the survey. This estimate is based on a weekly mark and recapture experiment in which salmon carcasses are tagged, chopped, and placed back into the river. The rate at which tagged carcasses are recovered (the recovery rate) relative to the number of carcasses checked for tags (chopped) provides the basis for an estimate of the total spawning population.

The Chinook Salmon spawning escapement survey began September 5 and continued through December 21, 2011. The survey was conducted in the low-flow channel and the high-flow channel from the Thermalito Afterbay Outlet downstream to the Gridley Bridge. Due to the low numbers of returning

fish in the high-flow channel, the data were pooled with the low-flow channel data to generate one estimate for the lower Feather River.

The carcass mark-recapture study resulted in a spawning population estimate of 47,301 Chinook Salmon for the lower Feather River. There were an estimated 11,668 grilse (fish less than 65 centimeters fork length). These estimates include both fall-run and spring-run Chinook Salmon since their spawning is currently not fully segregated on the Feather River.

Approximately 94.1 percent of the spawning population utilized the low-flow channel. Since 2000, the long-term average for the low-flow channel's spawning population is 79.1 percent. In the low-flow channel, survey section 10 (RM 65.5) had the highest carcass concentration followed by section 8 (RM 66.5). The highest concentrations of carcasses in the high-flow channel were found in sections 34 (RM 53) and 38 (RM 51).

Spring-run Chinook Salmon Tagging

To better understand spring-run Chinook Salmon life history in the lower Feather River, a program was developed to mark spring-run Chinook Salmon entering the FRFH. The spring-run Chinook Salmon tagging program segregates spawning of spring- and fall-run Chinook Salmon in the hatchery. The program also investigates potential differences in spawning distribution and timing of the early arriving spring-run salmon in the river.

Early arriving spring-run salmon entering the hatchery were marked with individually numbered Hallprint dart tags for identification. Once marked, the fish were released back in the river. During the hatchery spawning season, the tags enabled hatchery staff to distinguish the early arriving spring-run fish from the fall-run fish, so that spring-run fish could be spawned separately

from the fall-run. The tags also enabled the escapement survey crew to differentiate spring- and fall-run salmon, so that potential differences or trends in the in-river spawning behavior of the two runs could be analyzed.

In 2011, 6,028 Central Valley spring-run Chinook Salmon were tagged at the FRFH. Tagging began on June 6 and ended on July 5. When spawning commenced in the fall, a total of 3,600 tagged fish were recaptured: 1,969 at the FRFH and 1,631 in the river escapement survey.

Otolith Thermal Marking Studies

The Chinook Salmon run in the Feather River consists of both Central Valley spring-run and fall-run fish, both of which are heavily supplemented by the FRFH. To effectively determine the composition of the run (spring-run versus fall-run) and the origin of the fish (hatchery versus naturally produced), DFW and DWR developed an otolith thermal marking program for the FRFH. Thermal marking is an efficient method to mark 100 percent of the fish produced at the hatchery.

In 2005, 100 percent marking of hatchery-produced spring- and fall-run Chinook Salmon began. In 2011, otolith collection continued, and otoliths from 2009–2010 were being processed and analyzed. With continuation of this program, DWR will be able to definitively determine the origin and the proportions of spring- and fall-run fish within the river and the hatchery. With known origin and race, more advanced otolith analysis techniques can be employed to investigate potential differences in life history strategy for fall- and spring-run fish, as well as hatchery and naturally produced Chinook Salmon. This will provide valuable information to evaluate the effectiveness of past management decisions aimed at the recovery of natural-origin Chinook Salmon and guide future restoration actions.

Snorkel Surveys

From 1999 to 2001, DWR conducted a snorkel survey focusing on juvenile steelhead, but including other species and life stages. In 2010, DWR reinstated the lower Feather River snorkeling surveys with the following objectives:

- (1) determine the relative abundance and distribution of juvenile Chinook Salmon and steelhead prior to habitat improvements;
- (2) identify habitat conditions (depth, substrate, velocity, and cover) where juvenile Chinook Salmon and steelhead occur;
- (3) identify potential sites for gravel supplementation, channel improvement, and structural habitat restoration; and
- (4) identify habitat deficiencies for juvenile Chinook Salmon and steelhead in the lower Feather River prior to habitat improvement implementation.

In 2011, objectives (1) and (2) were achieved. In addition, channel size was identified as an important predictor of age-0 abundance, and other high-use areas of the low-flow channel that may benefit from habitat improvements were identified.

As the study progresses, additional sampling and analyses are expected, and as habitat restoration projects begin, these and future surveys will help guide and improve habitat projects.

Green Sturgeon Studies

This project fulfills some terms and conditions listed in NOAA Fisheries' draft biological and conference opinion for the relicensing of the Oroville Facilities. The primary objectives for this sturgeon study were to:

- determine if there are adult migration barriers;

- evaluate migration patterns including residence times and factors affecting them;
- identify distribution and habitat preferences;
- evaluate the effect of Oroville Facilities operations on passage success and distribution;
- estimate the annual abundance of adult Green Sturgeon;
- determine potential spawning grounds that can be target areas for egg and larval surveys; and
- provide DWR, the Federal Energy Regulatory Commission, NOAA Fisheries, and DFW with data to make management decisions concerning future monitoring programs, operational changes of the facilities, and/or habitat enhancement within the lower Feather River.

An acoustic telemetry tagging study coupled with a sonar study helped identify how operation of the Oroville Facilities affects Green Sturgeon in the lower Feather River.

Sonar surveys were conducted between February 22 and November 3, 2011. Analysis of data confirmed an observed 137 sturgeon between April 11 and September 8. The majority of sightings occurred in April with a population estimate of between 21 and 28 sturgeon.

Acoustic tags were placed inside two Green Sturgeon and one White Sturgeon at the Thermalito Afterbay Outlet. One Green Sturgeon emigrated on September 6 and the other on October 4. The White Sturgeon emigrated from the lower Feather River on December 25.

DWR was able to gather foundational data for all the primary objectives.

Lower Feather River Green Sturgeon Spawning Survey

The primary objectives for this study were as follows:

- (1) determine if spawning occurs in the lower Feather River;
- (2) identify spatial and temporal distribution;
- (3) characterize habitat preferences; and
- (4) determine if eggs are viable.

Two sites were surveyed based on locating sturgeon aggregations with sonar. Thirteen Green Sturgeon eggs were sampled between June 14 and 22 in the Thermalito Afterbay Outlet pool (RM 59). Eggs were not collected from Sunset Pumps (RM 38).

It was determined that spawning occurred in the lower Feather River (objective 1) and that eggs were viable (objective 4). DWR has begun to: identify spatial and temporal distribution (objective 2); characterize habitat preferences (objective 3); and provide data for making management decisions on future monitoring programs, operational changes of the facilities, and habitat enhancement within the lower Feather River.

Steelhead PIT Tagging

A broad range of restoration and recovery efforts have been initiated in the lower Feather River to bring about the recovery of its steelhead population; however, the ability to measure their success or improve the status of Central Valley steelhead has been hampered by a lack of information regarding steelhead life history and population dynamics. Because of this lack of information, DWR began a tagging program aimed at identifying behavior and life history traits of steelhead spawned at FRFH.

In December 2008, a passive integrated transponder (PIT) tagging program began at the FRFH. All steelhead used for broodstock at the FRFH are returned to the river.

PIT tagging adults prior to their release allows for future returning steelhead to be identified. Data gathered from returning tagged broodstock will provide information on multiyear return rates, relative success of brood years, and behavior within a spawning season.

In the 2010–2011 season, DFW began collecting tissue samples from spawned fish. Using a hole-punch, a small amount of tissue was taken from the caudal fin. A PIT tag shed was identified by the presence of a hole-punch tag and the absence of a detectable PIT tag. The hole-punch mark enabled the evaluation of PIT tag shed rates for post-spawn males and females.

Run size was determined and repeat spawner return rates were calculated. In 2011, the proportion of first-, second-, and third-time spawners based on multiyear recaptures was estimated.

FRFH steelhead run sizes for the 3 years of the study have varied greatly, from 232 fish in the 2009 season, to 59 fish in the 2010 season, and 534 fish in the 2011 season. In-season recapture rates were 8.19 percent, 6.78 percent, and 20.04 percent for these seasons, respectively. Males were recaptured multiple times in-season, while females were not.

In the 2010 season, 3 of the 59 fish (5.08 percent) were recaptured from the previous year. In the 2011 season, 5 of the 534 fish (0.94 percent) were recaptured from previous years. Based on PIT tag recoveries, the estimated spawning frequency for 2011 was 99.06 percent first-time spawners, 0.56 percent second-time spawners, and 0.38 percent third-time spawners.

A total of twelve in-season recaptures in the 2011 season had shed their PIT tags. The PIT tag shed rate for males was 3.8 percent (3 of 78) and for females was 31.0 percent (9 of 29).

Fish-related Mitigation Projects

In 1986, DWR and DFW signed the Delta Pumping Plant Fish Protection Agreement (Delta Fish Agreement) to annually provide funds to offset direct losses of Chinook Salmon, steelhead, and Striped Bass at Banks Pumping Plant. The Delta Fish Agreement is commonly referred to as the Four Pumps Agreement because it was adopted as part of the mitigation for four additional pumps at Banks Pumping Plant. Direct losses are defined as losses of fish that occur from the time fish are drawn into Clifton Court Forebay until the surviving fish are returned to the Delta. In principle, DFW and DWR intended this agreement to offset direct losses of all fish caused by the diversion of water by the pumping plant starting in 1986. However, at that time, information on impacts and measures to offset those impacts was sufficient only to deal with Chinook Salmon, steelhead, and Striped Bass. The agreement allowed for addressing impacts on other fish species once impacts could be identified and measures could be developed that would offset such impacts.

The process that led to this agreement included an advisory committee of representatives from interest groups concerned with fish resources affected by the SWP, including, but not limited to, representatives of the SWP water contractors, sport and commercial fishing groups, and environmental groups. The agreement formalized the Delta Pumping Plant Fish Advisory Committee.

To mitigate fish loss, mitigation projects are selected and funded by the Delta Fish Agreement. The agreement outlines how project proposals are reviewed and selected for funding and gives priority to mitigation measures for habitat restoration and other nonhatchery measures. Under the agreement, DWR calculates fish loss as

prescribed in the agreement, and approved mitigation projects earn fish mitigation credits to satisfy the fish loss mitigation provisions in the agreement. Mitigation is on a fish-for-fish basis.

DWR and DFW work with the Delta Pumping Plant Fish Advisory Committee to review the success of the agreement in offsetting the direct effects of diversions by Banks Pumping Plant. If warranted, the agreement can be renegotiated to fulfill the SWP's responsibilities to compensate direct fish loss. The agreement requires DWR and DFW to conduct an annual review and report the results.

The agreement provides for two funding components. One component is the Annual Mitigation Account for compensating the annual fish loss. It has no expiration date. The second is a \$15 million Lump Sum Account provided by DWR for additional projects to compensate for post-1986 fish loss. The agreement specifies that the \$15 million must be expended by December 29, 1996.

The Delta Fish Agreement has been amended three times:

- Amendment 1 (1996)—extended the period to expend the remaining \$9 million of the \$15 million to December 29, 2001;
- Amendment 2 (2001)—extended the period to expend the remaining \$5 million of the \$15 million to December 31, 2004; and
- Amendment 3 (2004)—extended the period to expend the remaining \$3.6 million of the \$15 million to December 31, 2007.

Since 1986, DWR has spent \$57 million on mitigation projects developed under the Delta Fish Agreement. (For a list of some of the mitigation projects initiated,

approved, or implemented in association with the agreement, see Bulletin 132-09.) Mitigation fund expenditures through December 31, 2011, were \$44 million for the Annual Mitigation Account and \$13.5 million for the \$15 million Lump Sum Account. Funds approved but unexpended from each account were \$10 million and \$1.5 million, respectively.

Climate Change

In this century, climate change will have a dramatic effect on water supply, flood management, and ecosystems. The SWP is particularly vulnerable to changes in climate. For example, climate warming is expected to continue to diminish the natural snowpack and shift reservoir inflows to earlier in the year when it cannot be stored due to flood control rules. In the future, sea level rise may also impair DWR's ability to efficiently operate the SWP. For instance, as sea levels rise, more saline water flows into the Sacramento-San Joaquin Delta, the heart of California's water supply system. To counter this sea water intrusion, additional water may need to be released from reservoirs. And climate change will exacerbate existing ecological issues in Central Valley rivers and the Delta by raising water temperatures, increasing sediment loading (as a result of increased wildfires and more extreme precipitation events), and increasing water demands.

DWR is committed to contributing to statewide, national, and international efforts to mitigate the future impacts of climate change by reducing greenhouse gas (GHG) emissions from its activities and adapting to expected climate changes. DWR's efforts throughout 2011 represent the continuation of its multipronged approach to addressing these issues by conducting research to better understand potential future impacts, monitoring and reporting GHG emissions, and developing plans and strategies to improve the resiliency of SWP facilities

and operations. During 2011, DWR added two additional activities to address climate change: consultation with outside experts and data development and curation.

Completed in 2011

Research

Isolated and integrated effects of sea level rise, seasonal runoff shifts, and annual runoff volume on California's largest water supply.

This study used different methods of climate projection to better understand the strengths and weaknesses of each method and how use of each might influence modeling results for water resource planning purposes. Reservoir inflow projections were made and used in an operations model to simulate future climate and water delivery conditions. This study was published in the *Journal of Hydrology* in 2011.

Ongoing in 2011

Research

Upper Watershed Restoration. DWR continued to work with the U.S. Forest Service on a study initiated in 2009 to investigate the hydrologic effects of upper watershed restoration. DWR is funding a 3-year investigation of the hydrologic effects of meadow restoration and how restored meadows can contribute to improved hydrologic and ecosystem functioning.

During 2011, the project completed a bibliography of scientific literature pertaining to meadow restoration and its beneficial effects on streamflow and an inventory of meadow communities in the Sierra Nevada significantly more accurate than previous inventories.

Additionally, during 2011, the following activities were initiated and are ongoing. The extent and degree of meadow erosion is being quantified by field measurements in a sample of meadows throughout the Sierra Nevada. Instrumentation for determination

of meadow water budget and measurements of hydrologic parameters has been installed in nine degraded and undegraded meadow communities. Flow processes in mountain meadows are being modeled and investigated to predict the effects of meadow erosion.

Sensitivity Analysis of Sierra Nevada Upper Watersheds to Temperature Changes Using the Soil and Water Assessment Tool.

Hydrologic models are essential tools for evaluating long-term hydrologic changes in California. The Soil Water Assessment Tool (SWAT) is being used to develop individual models of six representative Sierra Nevada watersheds: the Yuba River, Feather River, and American River in the northern Sierra; and the Tuolumne River, Merced River, and San Joaquin River in the southern Sierra. A common and consistent database of digital elevation, land use, soil data, and climate data is used with a geographic information system to develop the SWAT models.

During 2011, SWAT models were developed and calibrated for outflows for 10 watersheds: the Shasta River, Feather River, Yuba River, American River, Merced River, Tuolumne River, Trinity River, Bear River, San Joaquin River, and Putah Creek. For seven of the watersheds, models determined how outflows were affected by modified hydrology resulting from increased air temperature.

The project will continue with the development and calibration of computer-based rainfall/runoff models for other watersheds in the Sierra Nevada and Coast Range mountains to determine impacts of increased air temperature on outflows and use of developed models to determine the impacts of potential global warming.

Reoperation of Water Supply and Flood Protection Systems. California's water system is composed of State, federal, and local agencies, each having infrastructure

in place to provide water supply and flood control benefits. The current operation of these independent systems is based on physical and legal constraints. Changes in the climate, legal framework, and social values associated with water use may require modifications to existing operations and management procedures, new facilities, and new laws.

As authorized in Senate Bill X2 1, DWR initiated a system reoperation study to identify potential reoperation strategies of California's existing water supply and flood protection systems that will optimize the use of existing facilities and groundwater storage capacity. Senate Bill X2 1 defines the following objectives for the System Reoperation Program:

- integrate flood protection and water supply systems to increase water supply reliability and flood protection, improve water quality, and provide for ecosystem protection and restoration;
- reoperate existing reservoirs, flood facilities, and other water facilities in conjunction with groundwater storage to improve water supply reliability, flood control, and ecosystem protection, and to reduce groundwater overdraft;
- promote more effective groundwater management and protection and greater integration of groundwater and surface water resource uses; and
- improve existing water conveyance systems to increase water supply reliability, improve water quality, expand flood protection, and protect and restore ecosystems.

A plan of study for the project was completed in 2011.

More information on the System Reoperation Program can be found on DWR's website.

National Research Council Sea Level Rise on the Coast of California, Oregon, and Washington.

In 2011, work continued on the National Research Council's sea level rise study called for in Executive Order S-13-08. Serving as overall project manager, DWR executed contracts with four other State agencies and with the states of Oregon and Washington for their financial support of the study. Three federal agencies—the U.S. Geological Survey, National Oceanic and Atmospheric Administration, and U.S. Army Corps of Engineers are also providing funding. The study report will provide best available science estimates of a range of likely amounts of local sea level rise in 2030, 2050, and 2100. The report is expected to be completed in late spring 2012.

Planning

Integrated Resource Plan for the SWP. To help reduce the SWP's reliance on fossil-fired power generation, with its associated adverse impacts, DWR has developed an integrated resource plan for procuring power that will increase the use of renewable energy as part of the SWP's power portfolio, and thereby reduce GHG emissions in California. This plan is consistent with State policy and the goals established by Executive Order S-3-05 (which established GHG emission reduction goals for California).

Prior accomplishments include:

- commitment to termination of the long-term power purchase agreement for energy from Reid Gardner Unit No. 4, a coal plant in Nevada (the SWP's carbon dioxide emissions levels will be reduced to nearly half of what they were in 1990);
- completion of a renewables procurement plan;
- entrance into a long-term power purchase agreement with Northern California Power Agency for 33.5 percent of the output of the Lodi Energy Center, which will be a low GHG-emitting

generating plant that will be operational in 2012; and

- development and maintenance of a transparent and accurate record of the SWP's energy profiles, baselines, and GHG emissions.

Accomplishments in 2011 included:

- issuance of a Request for Proposal for qualified renewable energy to serve the SWP;
- ongoing investigations of cleaner technologies such as natural gas combustion turbines, wind energy, small hydroelectric generation, and energy efficiency projects for suitability to serve SWP load;
- completion of an initial evaluation of adding a second small hydroelectric generating unit at Alamo Powerplant;
- initiation of discussions and a memorandum of understanding with the University of California for solar development adjacent to SWP's Pearblossom Pumping Plant; and
- initiation of an energy efficiency improvements study that includes the refurbishment and replacement of DWR's hydroelectric generators and pumps at key SWP plant facilities (further refurbishments or replacements at the Gianelli Pumping-Generating Plant and the Edmonston Pumping Plant, which are the largest SWP loads, are currently being studied).

DWR Climate Action Plan Phase I: GHG Emissions Reduction Plan. During 2011, work continued on development of Phase I of the Climate Action Plan—GHG Emissions Reduction Plan. The plan, when complete, will document

- DWR's progress and future plans for reducing GHG emissions consistent with the GHG emissions reduction targets established in Assembly Bill 32, Executive Order S-3-05, and DWR's own policies;

- the aggressive steps DWR will take to reduce its emissions by more than 80 percent below 1990 levels; and
- the steps that DWR will take to monitor its progress toward achieving these reductions.

During 2011, meetings and consultations were conducted with all of DWR's divisions that have operational control over activities that release GHGs. In January 2011, the first complete draft for internal review was released. Throughout 2011, additional refinements were made and additional drafts were circulated for review by the Climate Change Matrix Team, DWR Governance Board, and DWR staff. Additional reviews were also conducted with outside experts including attorneys from the Attorney General's Office. Completion of the GHG Emissions Reduction Plan is expected in mid-2012.

Reporting

2011 Emissions Reports to The Climate Registry. Between 2007 and 2009, DWR reported its estimated total direct and indirect GHG emissions to the California Climate Action Registry, and earned Climate Action Leader Status each year. In 2010, emissions reporting transitioned to The Climate Registry, which is a North America-wide registry.

DWR's emissions are primarily the result of electricity generation at DWR-owned power plants and power purchase transactions to provide power for operation of the SWP. DWR's 2011 Greenhouse Gas Emissions Report has been verified by an independent third-party verifier and accepted by The Climate Registry. DWR is currently in the process of reviewing its methodology for reporting emissions to The Climate Registry because the current methodology results in an overstatement of DWR's GHG emissions of approximately 1 million tons per year.

Initiated in 2011

Research

Tree-ring Reconstruction of Paleostreamflows in the Sacramento, San Joaquin, and Klamath River Basins. DWR executed a contract with the University of Arizona for development of tree-ring reconstructions of paleostreamflows in the Sacramento, San Joaquin, and Klamath river basins. Extending streamflow records beyond the relatively short period of the historical record provides an improved picture of climate variability and yields data for use in analyses. Contract work began in fall 2010; the final report will be completed in 2014.

Review and Consultation

Formation of a Climate Change Technical Advisory Group. In 2011, DWR issued a Request for Statements of Interest to serve on a voluntary climate change advisory board. DWR has received significant interest and expects to form the group in early 2012. The Climate Change Technical Advisory Group will be a review and consultation panel of outside experts in the fields of atmospheric science, hydrology, civil engineering/infrastructure, environmental science, climate data and statistics, social science, resource economics, land-use planning, law, and climate modeling. The Climate Change Technical Advisory Group will advise DWR on the scientific aspects of climate change, its impacts on water resources, the use and creation of planning approaches and analytical tools, and the development of adaptation responses. This standing technical advisory group on climate change impacts and adaptation serving all DWR programs provides external guidance and support for a variety of climate-related issues, including scientific review of climate change models and scenarios, interpretation of scientific information produced by the National Climate Assessment and the upcoming Fifth Assessment Report of the Intergovernmental Panel on Climate Change, and informing DWR's climate

change adaptation policies. Benefits include consistency in the scientific advice DWR receives on climate change and the administrative efficiency of not having redundant climate change advisory groups across DWR.

Data Development and Curation

Formation of DWR Climate Change Basic Data Workgroup. The workgroup formed in 2011, with monthly meetings to strategize on data collection and management issues within DWR. The workgroup is composed of representatives from the Division of Statewide Integrated Water Management, the Division of Flood Management, and DWR's regional offices. The project goals are to assess current climate data acquisition efforts at DWR, promote cooperation and coordination across programs, and strategize on issues of data storage, management, and dissemination. An internal memorandum report on volunteer climate data collection and future recommendations is being prepared for release in 2012. A partnership with the Western Regional Climate Center is being pursued for coordination of statewide climate data collection, storage, and dissemination.

Environmental Document Review

DWR's Division of Environmental Services, Environmental Document Review Section screens State Clearinghouse documents and circulates SWP-related materials for review by O&M, the State Water Project Analysis Office, and others, as necessary. Other divisions and offices are notified and asked to comment when their expertise is required. The Environmental Document Review Section was formally moved from the Division of Statewide Integrated Water Management to the Division of Environmental Services in April 2011.

Some environmental documents handled by the State Clearinghouse concern proposed activities that would affect the SWP. Such documents are regularly reviewed to identify any public safety or liability issues arising from the proposed activities.

During 2011, the Environmental Document Review Section tracked documents related to development along the California Aqueduct, levee encroachment, dam safety issues, water transfers and other water supply issues, wastewater treatment, quarry development, solar and wind power facilities, and climate change issues. Climate change issues increased from two documents in 2010, when Senate Bill 97 was added to the State CEQA Guidelines in March, to five climate change documents plus seven general plans with climate change issues in 2011.

DWR comments submitted through the CEQA and/or NEPA processes addressed a number of issues, including runoff from proposed developments, safety and water supply, conveyance of nonproject water through SWP facilities, encroachment on physical facilities, impacts to crossdrainage facilities, cropping patterns, and climate change.

In 2011, the Environmental Document Review Section screened 2,759 State Clearinghouse documents. After screening, 1,137 documents were referred for information, including notices of preparation and various final documents, and 140 formal referrals were made for negative declarations, notices of preparation, EIRs, and NEPA documents.

O&M received 87 formal referrals and the State Water Project Analysis Office received 5 formal referrals.

The total number of referrals to O&M and the State Water Project Analysis Office decreased by about one-fourth from 2010. A significant factor contributing to this decrease was the

overall decrease in documents submitted through the environmental process (down about 7 percent), probably related to the continuing effects of the economic downturn. While the reduction in submitted projects from the State Clearinghouse has continued, this appears to be slowing down.

In 2011, formal referrals to all other DWR reviewers, including the Central Valley Flood Protection Board and the Division of Dam Safety, were down 15 percent from 2010. This reduction may be relatively insignificant since the total number of referrals was small when compared to the total number of documents (56 were referred in 2010 and 48 in 2011).

Chapter 4 Water Quality Programs

Middle River at the State Route 4 bridge.

Significant Events in 2011

*T*he final environmental impact statement/environmental impact report for the *Suisun Marsh Habitat Management, Preservation, and Restoration Plan* was completed in November 2011.

Information in this chapter was contributed by the Division of Environmental Services, the Division of Operations and Maintenance, and the State Water Project Analysis Office.

The State Water Project (SWP) is the largest state-built, multipurpose water project in the United States. California's existence and continued prosperity depends on water. More than two-thirds of the people of California rely partly or wholly on the SWP for their daily water needs. The Department of Water Resources (DWR), Division of Operations and Maintenance (O&M) currently maintains 16 automated water quality monitoring stations at key locations along the SWP. This network of automated stations continuously monitors a variety of water quality parameters throughout the system and provides real-time data to SWP water contractors. In addition, field grab samples collected weekly, monthly, quarterly, or annually from more than 30 SWP locations are routinely analyzed for a broad range of constituents at the State's Bryte Chemical Laboratory.

Delta Water Quality

Maintaining adequate water quality to support multiple beneficial uses of water from the San Francisco Bay/Sacramento-San Joaquin Delta (Bay-Delta) is of concern to DWR as well as other resource agencies. The State Water Resources Control Board (SWRCB) establishes water quality objectives to protect a variety of beneficial uses of water within the Bay-Delta. The objectives are contained within the water quality control plans (WQCPs) adopted by the SWRCB. Water quality objectives are also contained in Article 19 of the long-term SWP water supply contracts. The California Department of Public Health (CDPH) establishes maximum contaminant levels for treated drinking water.

Under its authority to protect beneficial uses of water, the SWRCB adopted the 2006 *Water Quality Control Plan for the San Francisco Bay/Sacramento-San Joaquin Delta Estuary* (Bay-Delta Plan) on December 13, 2006 (Resolution No. 2006-0098). It contains objectives for flow, salinity, dissolved oxygen (DO) levels, and other parameters necessary for protection of various beneficial uses such as municipal and industrial, agricultural, and fish and wildlife.

The SWRCB adopted Water Right Decision 1641 (D-1641) in December 1999 (amended March 15, 2000). D-1641

implemented the objectives of the 1995 Bay-Delta Plan. One method used by the SWRCB to implement the objectives in the WQCPs is through conditioning water rights permits. D-1641 amends the water rights of a number of water rights holders—primarily those for the SWP and Central Valley Project (CVP)—to help achieve the WQCP objectives.

For additional background information about the SWRCB activities and the Bay-Delta Plan, see the sidebar, State Water Resources Control Board, and Chapter 7, Water Supply Development and Reliability.

Strategic Workplan for the Bay-Delta Estuary

In 2008, the SWRCB adopted the *Strategic Workplan for Activities in the San Francisco Bay/Sacramento-San Joaquin Delta Estuary*. The strategic workplan identifies a broad, integrated list of water right and water quality activities. The workplan activities are divided into nine broad elements that cover a range of actions that implement SWRCB's and the Regional Water Quality Control Boards' (RWQCBs) core water quality responsibilities; continue meeting prior SWRCB and RWQCB commitments; respond to priorities identified by the Governor and the Delta Vision Blue Ribbon Task Force; and build on existing processes, such as the Bay Delta Conservation Plan (BDCP).

State Water Resources Control Board

The State Water Resources Control Board (SWRCB), established by the California Legislature in 1967, oversees water rights and protects water quality by setting and implementing statewide policy, administering appropriate water rights, coordinating with and supporting Regional Water Quality Control Board (RWQCB) efforts, and reviewing petitions that contest RWQCB actions. The five SWRCB members are appointed by the Governor and confirmed by the Senate. SWRCB is responsible for four major programs.

Water quality: to preserve, protect, enhance, and restore water quality.

Water rights: to issue permits for water rights specifying amounts, conditions, and construction timetables for diversion and storage.

Financial assistance: to assist local agencies and individuals with pollution prevention or clean-up.

Enforcement: to enforce water rights and water quality laws and regulations.

Under their water quality authority, the SWRCB and RWQCBs adopt water quality control plans (WQCPs) for each of the planning basins in the State. The WQCPs contain water quality objectives for flow, salinity, dissolved oxygen levels, and other parameters necessary for the protection of various beneficial uses, such as municipal and industrial, agricultural, and fish and wildlife. The SWRCB implements these objectives in a number of ways, depending on the circumstances, including imposing conditions on water right permits and licenses.

The SWRCB amended Water Right Decision 1641 (D-1641) on March 15, 2000, which placed terms and conditions on a number of water rights, primarily those for the State Water Project (SWP) and Central Valley Project (CVP). D-1641 implemented the objectives in the 1995 Bay-Delta Plan. The Department of Water Resources and the Bureau of Reclamation operate the SWP and CVP in coordination to meet the terms in D-1641 and other applicable regulatory requirements relevant to each project.

Current water quality objectives for the Sacramento-San Joaquin Delta and Suisun Marsh are contained in the *WQCP for the San Francisco Bay/Sacramento-San Joaquin Delta Estuary* (Bay-Delta Plan), adopted December 13, 2006. The SWRCB is required to conduct periodic updates of the Bay-Delta Plan. As part of the update process, the SWRCB conducts proceedings to gather information, receive recommendations, consider public comments, and facilitate detailed discussions to evaluate new information relevant to potential changes to the water quality objectives.

Some of the recent issues of concern related to the WQCP include pelagic organism decline, special status fish species, Delta inflow, San Joaquin River flows, and southern Delta salinity.

In July 2008, the SWRCB adopted the *Strategic Workplan for Activities in the San Francisco Bay/Sacramento-San Joaquin Delta Estuary*, which prioritizes and describes the scope of individual activities and provides specificity regarding timelines and resource needs for implementing coordinated activities in the Bay-Delta.

The SWRCB staff prepare quarterly updates on the implementation of the workplan and, as appropriate, recommend modifying activities in the workplan to ensure that SWRCB actions continue to protect beneficial uses in the Bay-Delta. SWRCB will consider modifying the Bay-Delta strategic workplan as necessary.

In May 2011, SWRCB staff issued an update to the strategic workplan's element actions and timelines.

2006 Bay-Delta Plan Review

Water Code Section 13240 requires that the WQCP be periodically reviewed. Federal Clean Water Act Section 303(c) (33 U.S.C. Section 1313(c)) requires a triennial review of State water quality "standards," as defined in the act. The comprehensive review of the 2006 WQCP and its implementation is one of the significant water quality related activities in the SWRCB strategic workplan.

The WQCP review and amendment process consists of review of the 2006 Bay-Delta Plan to identify elements that may need amendment or new elements that may need to be added, staff preparation of any amendments or revision of the entire WQCP, and SWRCB adoption of some or all of the amendments or revisions. SWRCB information-gathering activities may affect the scope of the WQCP review and may include a series of evidentiary hearings on a number of critical issues concerning the Delta's ecology. The BDCP environmental review may include some of the analyses needed for the comprehensive WQCP review. The intent of the comprehensive review is to establish interim and long-term water quality objectives in the Bay-Delta that are protective of fish and wildlife beneficial uses and the public trust. The comprehensive review will also develop a broad range of alternatives for potential changes to the Bay-Delta Plan and its implementation under the following scenarios: in the interim until any

new conveyance facility is completed; in the long-term with new conveyance facilities; and in the long-term in the event that a new conveyance facility is not constructed.

Review of the 2006 Bay-Delta Plan began in 2008. In 2011, SWRCB's ongoing review and update of the 2006 Bay-Delta Plan continued. SWRCB held workshops for discussion and consideration of the scope and content of SWRCB's environmental document relating to the review of the Bay-Delta Plan and the *Draft Technical Report on the Scientific Basis for Alternative San Joaquin River Flow and Southern Delta Salinity Objectives*. SWRCB initiated an external scientific peer review of the technical report; the peer review was completed in November 2011.

Operations Under D-1641

In 2011, DWR and the Bureau of Reclamation (Reclamation) jointly operated the SWP and CVP in accordance with D-1641, which includes water quality, flow, and operational criteria for the SWP and CVP Delta operations. SWP and CVP operations were coordinated to meet the various objectives of the Bay-Delta Plan, Central Valley Project Improvement Act, and biological opinions (BOs) for listed species as well as other regulatory requirements. Fish species currently listed under the Endangered Species Act and the California Endangered Species Act include the winter and spring runs of Chinook Salmon, Delta Smelt, steelhead, and Green Sturgeon.

Real-time monitoring of fish movement and conditions in the estuary aids daily water management and provides timely protection of targeted fish species from entrainment at the Delta pumping facilities.

(For a discussion of other environmental issues, see Chapter 3, Environmental Programs.)

D-1641 includes the requirement to monitor a number of stations within the Delta for specific water quality constituents. DWR conducts extensive monitoring in the Delta and the Suisun Marsh, as required. Figure 4-1 shows water quality compliance and monitoring stations throughout the Sacramento-San Joaquin Delta specified by D-1641.

Delta Cross Channel Gates

The Delta Cross Channel gates are operated in accordance with SWRCB D-1641. In 2011, the gates were open for 131 days to allow fresher Sacramento River water to flow into interior Delta channels toward the SWP and CVP export facilities. Reclamation's standard operating procedures call for gate closure when flow on the Sacramento River at Freeport reaches between 20,000 cubic feet per second (cfs) and 25,000 cfs to reduce flooding potential on the Mokelumne River and to prevent scouring on the downstream side of the gate structure. D-1641 contains measures that require gate closure under certain conditions from November 1 through May 20 for fisheries protection as requested by the U.S. Fish and Wildlife Service (USFWS), the National Marine Fisheries Service, and the Department of Fish and Wildlife (DFW).

Water Quality Standards

Water quality objectives in D-1641 are categorized by the beneficial uses they are intended to protect, including municipal and industrial, agricultural, and fish and wildlife. DWR operators adjust upstream releases and Delta exports in order to meet D-1641 water quality and flow standards. D-1641 contains salinity standards (recorded as electrical conductivity [EC]) for three stations in the South Delta downstream of Vernalis. The stations are primarily influenced by San Joaquin River flows and in-Delta diversions. San Joaquin River flows are not influenced by SWP upstream reservoirs, but local water

levels may be influenced by SWP exports, and circulation may be influenced by the annual placement of South Delta barriers.

For more information about the South Delta barriers, see Chapter 2, Delta Resources, and Chapter 3, Environmental Programs.

Water Year 2010–2011 Classifications and Water Supply Indices

SWRCB's D-1641 contains water quality and flow standards that are conditioned by water year type and generally become less stringent in years with less precipitation. The water year classification system provides relative estimates of a basin's available water supply based on the amounts of rainfall, snowmelt runoff, and groundwater accretion rates. Water year types are classified as "wet," "above normal," "below normal," "dry," or "critical."

The Sacramento Valley Water Year Hydrologic Classification (Sacramento Valley 40-30-30 Index) forecast on May 1 of each year determines the water year type for the implementation of flow and water quality criteria contained in D-1641. In 2011, the SWP and CVP were operated using water quality and flow criteria based on the May 1 forecast of a wet water year for the Sacramento River basin.

The Sacramento Valley 40-30-30 Index and the San Joaquin Valley Water Year Hydrologic Classification (San Joaquin Valley 60-20-20 Index) were both wet, based on all observed data for water year 2010–2011.

For a detailed discussion of water year 2010–2011, see Chapter 8, Water Supply.

Municipal and Industrial Objectives

D-1641 includes a year-round 250 milligrams per liter (mg/L) (maximum mean daily) chloride objective that is in effect at Delta

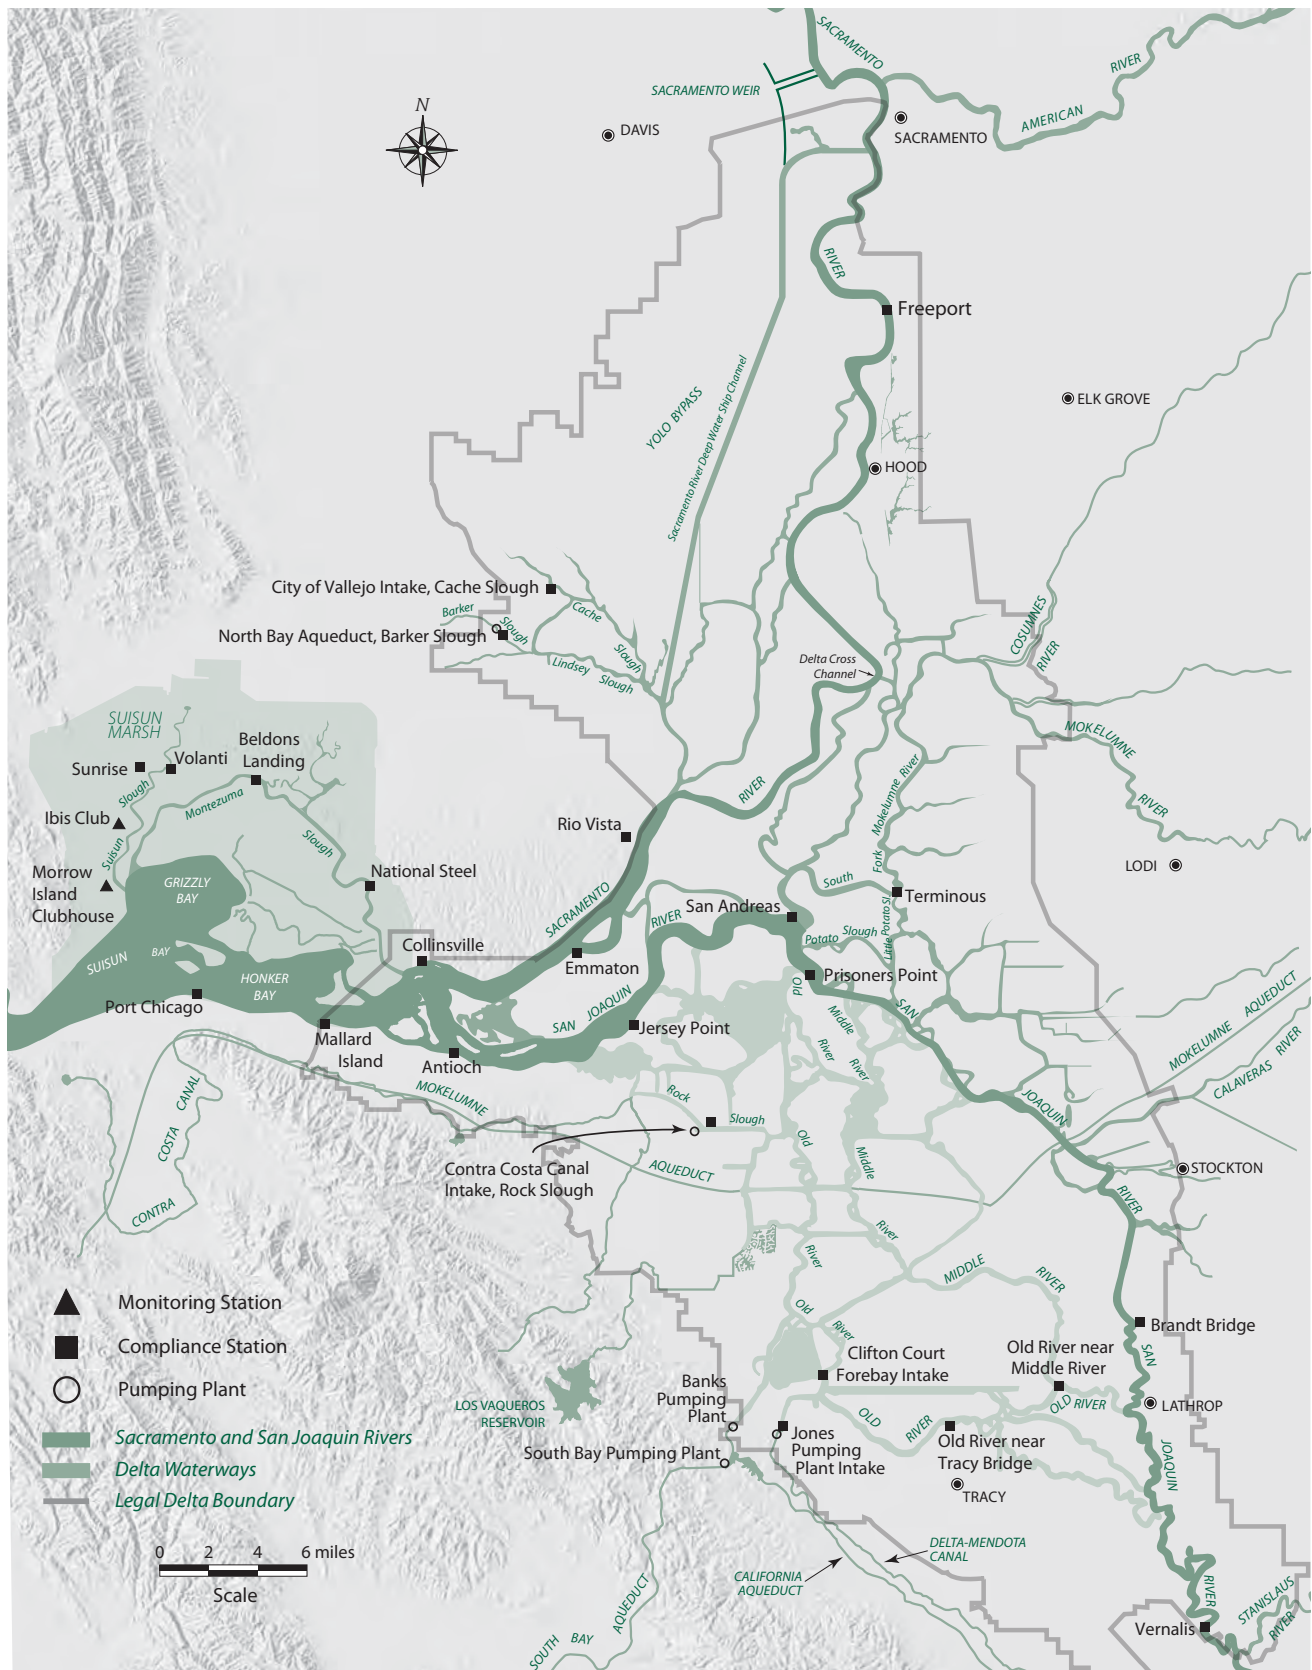

Figure 4-1 Decision 1641 Water Quality Compliance and Monitoring Stations in the Sacramento-San Joaquin Delta

export locations (Contra Costa Canal Pumping Plant No. 1, Clifton Court Forebay, Jones Pumping Plant, Cache Slough at the City of Vallejo Intake, and Barker Slough). Chloride levels remained below the objective for all days in 2011.

An additional municipal and industrial water quality objective for chloride at the Contra Costa Canal Intake, near Rock Slough, specifies that the chloride level must be below 150 mg/L for a given number of days during the year, dependent upon the water year forecast. This objective was met in calendar year 2011.

Agricultural Objectives

D-1641 contains agricultural salinity objectives, which vary by location. The salinity objectives, recorded as EC, are based on both water year type and a 14-day running average during the irrigation season, from April to mid-August, at Emmaton, Jersey Point, Terminous, and San Andreas in the West and Central Delta. The agricultural salinity objectives at these Delta locations become less stringent under dryer conditions. Emmaton and Jersey Point met the objective in 2011. (Data for Terminous and San Andreas were not available.)

In the South Delta, the salinity objectives are based on a 30-day running average. The 0.7 millisiemens per centimeter (mS/cm) objective for the South Delta was met at Vernalis, Old River near Middle River, Old River near Tracy Road Bridge, and Brandt Bridge. The SWP and CVP are jointly required by D-1641 to meet the agricultural EC objectives imposed at these South Delta compliance locations.

See also, Chapter 2, Delta Resources, and Chapter 7, Water Supply Development and Reliability.)

Estuarine Habitat Protection Standard

The estuarine habitat protection standard incorporates modified X2 criteria (geographic isohaline) first established in the 1994 Delta Smelt BO. The upstream movement of 2 parts per thousand isohaline (2 parts per thousand of salt in the water), measured as 2.64 mS/cm at the surface, is maintained within a certain range of positions in the estuary by adequate Delta outflow. These positions (Collinsville, Chipps Island, Port Chicago, or Martinez) are associated with an abundance of fish and biota.

The requirement for meeting X2 criteria at Collinsville applies to all days during February through June. The number of days per month when the daily average EC maximum (2.64 mS/cm) is in effect at Chipps Island or Port Chicago is conditioned by the previous month's Eight River Index (more information about this can be found in Chapter 8, Water Supply). This may alternately be met with a maximum 14-day running average EC of 2.64 mS/cm or with specific Delta outflow, set as a 3-day average Net Delta Outflow Index (NDOI) of 7,100 cfs, 11,400 cfs, or 29,200 cfs, when the X2 position is at Collinsville, Chipps Island, or Port Chicago, respectively. The Port Chicago standard becomes effective when the Port Chicago 14-day EC average, immediately prior to the first day of the month, is less than or equal to 2.64 mS/cm.

The Eight River Index for January through May 2011, in million acre-feet, was 2.10, 1.96, 6.20, 5.23, and 4.94, respectively. The X2 habitat protection objective at Chipps Island was 28 days in February, 31 days in March, 30 days in April, 30 days in May, and 29 days in June.

Additionally in 2011, the X2 habitat protection objective at Port Chicago was met in the month of June for 4 days.

Net Delta Outflow Index Standard

Delta outflow cannot be measured directly due to the tidal influence in the Delta. Instead, an approximation of Delta outflow is calculated using measured inflows, exports, and estimated Delta water use. The NDOI was introduced in the 1995 Bay-Delta Plan and is now part of D-1641. NDOI calculates Delta outflow using inflows of the Sacramento River, the Yolo Bypass system, the eastside stream system (consisting of the Mokelumne, Cosumnes, and Calaveras rivers), the Sacramento Regional Treatment Plant, and a measurement of San Joaquin River flow at Vernalis.

Excess outflow conditions, as defined by the Coordinated Operations Agreement, allow for greater flexibility in project operations.

D-1641 sets specific minimum monthly NDOI standards for the protection of fish and wildlife based on water year type. In 2011, the monthly mean NDOI was highest in March, averaging 91,000 cfs. The monthly mean NDOI remained above 3,000 cfs during all months of the year, with the lowest monthly mean NDOI occurring in December, with 5,637 cfs. All NDOI standards were met in 2011.

River Flow Standards

D-1641 includes minimum flow requirements measured in the Sacramento River at Rio Vista. These flow standards, incorporated from the winter-run salmon BO, set flow requirements based on the May 1 Sacramento Valley water year classification forecast. Water year 2010–2011 was forecast to be wet, requiring mean monthly flows of 4,000 cfs for October and 4,500 cfs for November and December. During these periods, the 7-day running average could not be more than 1,000 cfs below the monthly standard. The actual mean monthly flows were 12,639 cfs for September; 12,010 cfs for October; 6,840 cfs for November; and 11,552 cfs for December.

If the X2 objective is required to be at or west of the Chipps Island location, wet year base Vernalis flows are set at 3,420 cfs from February to April 14 and from May 16 through June 30. The base-flow objective is relaxed to 2,130 cfs when X2 is required to be east of Chipps Island.

D-1641 requires the San Joaquin River spring pulse flow for April 15 to May 15 at Vernalis. This spring pulse flow requirement varies based on the location of X2 during April. However, the CALFED Operations Group may vary the actual timing and duration of the pulse attraction flow based on real-time monitoring data.

VAMP marked its twelfth and final year of formal compliance with D-1641 in calendar year 2011. Actions associated with VAMP were implemented between May 1 and May 31. For more information about 2011 VAMP activities, see Chapter 3, Environmental Programs.

Additional information about San Joaquin River water quality can be found in Chapter 5, Local Assistance.

Export Standards

D-1641 includes an export limitation for the SWP and CVP. It limits Delta exports to a ratio of Delta inflow to combined water project exports and is expressed as a maximum export rate in percentage of Delta inflow. The maximum percentage of diverted Delta inflow varies by month; for example, in February, it is conditioned by the previous month's Eight River Index. During the San Joaquin River spring pulse flow season, VAMP export rates are typically used as an alternative to the D-1641 spring export limitation, and the CALFED Operations Group may impose additional export restrictions.

The actual export amount is calculated using the 3-day average that combines

the inflow rate for Clifton Court Forebay (excluding Byron-Bethany Irrigation District diversions from Clifton Court Forebay) added to the Jones Pumping Plant diversion. The export-to-inflow ratio limit is reported as either a 3-day or 14-day running average. A 14-day running average of inflows is used unless storage withdrawals from upstream reservoirs are being made for export, in which case a 3-day average of inflows is used. In all water year types, the maximum combined export rate from February through June is 35 percent of Delta inflow. This rate may be relaxed in February during years with less precipitation to between 35 and 45 percent. From July through January, the export-to-inflow ratio rises to 65 percent.

During 2011, the Delta was in excess conditions from January 1 to November 30, for a total of 334 days. Within this period, combined SWP and CVP exports averaged about 18 percent of Delta inflow, meeting the 65 percent limitation in January and from July to December, while also meeting the 35 percent limitation from February to May.

The Delta was in balanced conditions for 31 days from December 1 to December 31. Within this period, combined SWP and CVP exports averaged about 54 percent of Delta inflow, meeting the 65 percent limitation.

South Delta Temporary Barriers Project

The South Delta Temporary Barriers Project, initiated as a test project in 1991, was extended for 5 years in 1996, and extended again for 7 years in 2001. The project was created partially in response to a 1982 lawsuit filed by the South Delta Water Agency and consists of rock barriers across four South Delta channels.

These temporary seasonal barriers are designed to improve local water levels and circulation patterns, protect fishery

resources, and improve water quality. They are placed across Middle River, Old River near Tracy, Grant Line Canal, and at Head of Old River.

For more information about the temporary barriers, see Chapter 2, Delta Resources, and Chapter 3, Environmental Programs.

Special Study and Biological Surveys

DWR conducts several special studies and biological surveys each year. This includes a special study in the Stockton Deep Water Ship Channel (DWSC) during the late summer and early fall to monitor the occurrence of low DO levels. Low DO levels potentially cause physiological stress to fish and block the migration of salmon into the San Joaquin River. DWR also conducts biological surveys of benthic organism density and diversity and of phytoplankton biomass and community composition in the Sacramento-San Joaquin Delta, Suisun Bay, and San Pablo Bay.

Fall Dissolved Oxygen Study in the Stockton DWSC

Historically, during the late summer and early fall, DO levels in the eastern and central portions of the Stockton DWSC have dropped below both the 5.0 mg/L and 6.0 mg/L water quality objectives set by SWRCB and the RWQCB, respectively. These low DO levels are a result of several factors, including low San Joaquin River inflows, warm water temperatures, high biochemical oxygen demand, reduced tidal circulation, and intermittent reverse flow conditions in the San Joaquin River at Stockton.

To help reduce the severity of these low DO conditions, DWR normally installs a temporary rock barrier across Head of Old River during periods of projected low fall flows in the San Joaquin River.

In 2011, the spring barrier was not installed. Instead, a nonphysical “bubble barrier” was installed to prevent salmon from entering Old River. The fall Head of Old River barrier was not installed in 2011 because the existing flows and dissolved oxygen levels in the San Joaquin River were sufficient for Chinook Salmon, and it was not requested by DFW.

Methods

Monitoring DO concentrations in the Stockton DWSC was conducted by boat on 12 monitoring runs, from June 15 to November 23, 2011. During each run, 14 sites were sampled at low-water slack tide from Prisoners Point in the Central Delta to the Stockton Turning Basin at the terminus of the ship channel. Because monitoring results differ within the channel, sampling stations were grouped into western, central, and eastern regions. The western region of the channel begins at Prisoners Point and ends at Columbia Cut. The central region of the channel begins one-half mile east of Columbia Cut and ends at Fourteen Mile Slough. Finally, the eastern region of the channel begins at Buckley Cove and ends at Rough and Ready Island. The turning basin is unique within the channel because it is east of the entry point of the San Joaquin River into the channel and isolated from down-channel flows.

Results

During the period of this study (June 15 to November 23), DO levels varied by season and exhibited similar ranges between regions within the channel excluding the turning basin. Overall study period range was 6.3 to 9.8 mg/L at the surface and 6.5 to 9.4 mg/L at the bottom. In the western portion of the channel, DO concentrations ranged from 6.3 to 9.6 mg/L at the surface and 6.6 to 9.4 mg/L at the bottom. In the central portion of the channel, DO concentrations were variable, ranging from 6.6 to 9.4 mg/L at the surface and 6.5 to

9.3 mg/L at the bottom. In the eastern portion of the channel, DO levels tended to be more stratified than the other stations, ranging from 7.1 to 9.8 mg/L at the surface and 7.3 to 9.1 mg/L at the bottom. DO concentrations never fell below the State’s 5.0 mg/L and 6.0 mg/L objectives during the 2011 sampling.

Higher San Joaquin River inflows, as well as the absence of intermittent reverse flows near Stockton, coincided with improved DO conditions. Further monitoring operations for the fall 2011 special study were suspended after November 23, 2011.

Benthic Survey

The operation of the SWP can impact flow characteristics of the upper San Francisco Estuary and subsequently influence the density and distribution of benthic biota. Benthic biota are relatively long-lived and can respond to changes in physical factors within the estuary, such as fresh water inflows, salinity, and substrate composition. The benthic monitoring program documents changes in the composition, abundance, density, and distribution of the benthic biota within the estuary. Biological surveys conducted under the benthic monitoring program provide an indication of physical changes occurring within the upper estuary. In addition, benthic monitoring data are also used to detect and document the presence of newly introduced species within the upper estuary.

Benthic monitoring was conducted at 10 sampling sites distributed throughout the major habitat types within the estuary:

- Clifton Court Forebay Intake;
- San Joaquin River at Buckley Cove and at Twitchell Island;
- Old River opposite Rancho del Rio;
- Sacramento River below the Rio Vista Bridge and above Point Sacramento;
- Suisun Bay at Bulls Head Point;

- Grizzly Bay at Dolphin near Suisun Slough; and
- San Pablo Bay near Pinole Point and near the mouth of the Petaluma River.

Four bottom grab samples for benthic analysis and one sample for sediment analysis were collected monthly at each site during 2011. Samples were analyzed to identify organisms to the lowest possible identifiable taxon and to count all organisms collected.

DWR maintains a database of benthic organisms located within the upper estuary. The benthic database is dynamic and regularly undergoes peer review and update. When a new organism is identified at any of the sampling stations it is added to the database. In addition, the taxonomic names of organisms on the list are updated when sufficient evidence is produced to warrant such changes.

The benthic monitoring program collects a large number of organisms, but a relatively small number of species. A total of 211 species of benthic macrofauna were collected in 2011 at the 10 sampling sites. Of the 211 species, 10 represented 81 percent of all organisms collected:

- amphipods: *Ampelisca abdita*, *Americorophium spinicorne*, *Americorophium stimpsoni*, *Corophium alienense*, and *Gammarus daiberi*;
- Asian clams: *Potamocorbula* (formerly *Corbula*) *amurensis* and *Corbicula fluminea*;
- sabellid polychaete: *Manayunkia speciosa*; and
- tubificid worms: *Limnodrilus hoffmeisteri* and *Varichaetadrilus angustipenis*.

Of the 10 dominant species, *Potamocorbula amurensis*, and *Ampelisca abdita* represent macrofauna that inhabit a typically high saline environment and were found in

San Pablo Bay, Suisun Bay, and Grizzly Bay. *Corophium alienense*, *Americorophium spinicorne*, and *A. stimpsoni* tolerate a wider range of salinity. They were collected both in the higher saline western sites and the more brackish to fresh water eastern sites such as the San Joaquin River at Twitchell Island and the Sacramento River above Point Sacramento. The remaining five species, *Gammarus daiberi*, *Manayunkia speciosa*, *Limnodrilus hoffmeisteri*, *Varichaetadrilus angustipenis*, and *Corbicula fluminea*, are predominantly fresh water species and were collected at sites east of Suisun Bay.

Phytoplankton and Chlorophyll *a* Survey

Phytoplankton are small, free-floating or attached algae that can be tiny, single-celled organisms (less than 5 micrometers in diameter) or larger colonial organisms. Phytoplankton are an important source of food in the estuary for zooplankton, invertebrates, and some species of fish. Phytoplankton biomass is an indicator of the status of primary productivity in the estuary. Chlorophyll *a* is one of the main groups of pigments contained in the algal species that make up phytoplankton.

Monthly sampling of chlorophyll *a* concentrations and phytoplankton was conducted in 2011 by DWR's Bay-Delta Monitoring Branch at 13 stations throughout the upper San Francisco Estuary:

- Sacramento River at Greene's Landing/Hood and above Point Sacramento;
- San Joaquin River at Vernalis, Buckley Cove, and Potato Point;
- Old River opposite Rancho del Rio;
- Disappointment Slough near Bishop Cut;
- Frank's Tract near Russo's Landing;
- Suisun Bay at Bulls Head Point near Martinez and off Middle Point near Nichols;

- Grizzly Bay at Dolphin near Suisun Slough; and
- San Pablo Bay near Pinole Point and near the mouth of the Petaluma River.

Chlorophyll *a* concentration was measured at the 13 monitoring stations to estimate overall phytoplankton biomass in the estuary. Phytoplankton samples were collected and analyzed separately to determine which species were present in the estuary.

Monthly chlorophyll *a* concentrations throughout much of the estuary were relatively low. Of the 156 samples taken in 2011, 98.1 percent (153 samples) had chlorophyll *a* levels below 10 micrograms per liter ($\mu\text{g/L}$). Chlorophyll *a* levels below 10 $\mu\text{g/L}$ are considered limiting for zooplankton growth. Of the three samples with chlorophyll *a* concentrations above 10 $\mu\text{g/L}$, all were from two stations on the San Joaquin River during the summer months (Buckley Cove in July and Vernalis in July and August). The mean chlorophyll *a* concentration for all samples in 2011 was 3.22 $\mu\text{g/L}$; the median value was 2.26 $\mu\text{g/L}$. The mean was similar in 2010 (3.21 $\mu\text{g/L}$), but the median was lower (1.72 $\mu\text{g/L}$). The maximum chlorophyll *a* concentration in 2011 was 18.20 $\mu\text{g/L}$, recorded in July on the San Joaquin River at Buckley Cove. It was much lower than the maximum in 2010 (59.20 $\mu\text{g/L}$). The minimum chlorophyll *a* concentration was 0.35 $\mu\text{g/L}$, recorded in January on Old River opposite Rancho del Rio.

Phytoplankton biomass and resulting chlorophyll *a* concentrations in some areas of the estuary may be influenced by extensive filtration of the water column by the introduced Asian clam, *Potamocorbula amurensis*. Well-established benthic populations of *P. amurensis* in Suisun and San Pablo bays are thought to have contributed to the low chlorophyll *a* concentrations (and increased water clarity)

measured in these westerly bays since the mid-1980s.

In addition to monitoring for chlorophyll *a*, water samples were analyzed for pheophytin *a*.

Pheophytin *a* is a primary degradation product of chlorophyll *a*, and its relative concentration is useful for estimating the general physiological state of phytoplankton populations. When phytoplankton are actively growing, the concentrations of pheophytin *a* are normally expected to be low in relation to chlorophyll *a*. The mean pheophytin *a* concentration for all samples in 2011 was 1.30 $\mu\text{g/L}$, and the median value was 0.99 $\mu\text{g/L}$. The maximum pheophytin *a* concentration was 7.24 $\mu\text{g/L}$, recorded on the San Joaquin River at Vernalis in August. The minimum pheophytin *a* concentration was 0.16 $\mu\text{g/L}$, recorded in Grizzly Bay at Dolphin near Suisun Slough in December.

Cyanobacteria, centric diatoms, pennate diatoms, cryptomonads, and haptophytes constituted 99.4 percent of the organisms collected of the 12 groups identified.

All organisms collected in 2011 fell into these 12 categories (in order of abundance):

- (1) cyanobacteria (class Cyanophyceae);
- (2) centric diatoms (class Coscinodiscophyceae);
- (3) pennate diatoms (classes Bacillariophyceae and Fragilariophyceae);
- (4) cryptomonad flagellates (class Cryptophyceae);
- (5) haptophyte flagellates (class Prymnesiophyceae);
- (6) green algae (classes Chlorophyceae, Ulvophyceae, and Zygnematophyceae);
- (7) dinoflagellates (class Dinophyceae);
- (8) euglenoid flagellates (class Euglenophyceae);

- (9) chrysophyte flagellates (class Chrysophyceae);
- (10) ciliates (classes Kinetofragminophora and Spirotrichea);
- (11) little green algal balls (class unknown); and
- (12) kathablepharids (class Cryptophycophyta incertae sedis).

The 10 most common genera collected in 2011 were:

- (1) *Anabaena* (cyanobacterium; class Cyanophyceae);
- (2) *Aphanizomenon* (cyanobacterium; class Cyanophyceae);
- (3) *Cyclotella* (centric diatom; class Coscinodiscophyceae);
- (4) *Fragilaria* (pennate diatom; class Fragilariophyceae);
- (5) *Chroomonas* (cryptomonad flagellate; class Cryptophyceae);
- (6) *Aulacoseira* (centric diatom; class Coscinodiscophyceae);
- (7) *Cocconeis* (pennate diatom; class Bacillariophyceae);
- (8) *Cryptomonas* (cryptomonad flagellate; class Cryptophyceae);
- (9) *Pseudanabaena* (cyanobacterium; class Cyanophyceae); and
- (10) *Melosira* (centric diatom; class Coscinodiscophyceae).

Of particular note is the occurrence of a fall diatom bloom in many parts of the estuary that lasted several weeks. Fall blooms such as this one have not been seen since the early 1980s. Much of the discrete sampling was completed before the bloom began in mid-October, but it was detected at Disappointment Slough near Bishop Cut that month. The bloom lasted long enough to be detected in the November discrete sampling, and it was seen at several stations: the Sacramento River above Point Sacramento, Frank's Tract near Russo's Landing, the San Joaquin River at Potato

Point, Old River opposite Rancho del Rio, Disappointment Slough near Bishop Cut, and San Pablo Bay near Pinole Point and the mouth of the Petaluma River. The genus of diatom responsible for the bloom was *Aulacoseira sp.*, with a closely related genus (*Melosira sp.*) co-occurring at the Sacramento River above Point Sacramento.

Activities Outside the Delta

Routine SWP water quality monitoring activities, as well as special studies, are conducted outside the Delta. The special studies are in response to increasingly stringent regulations facing water purveyors who rely on DWR to deliver high-quality raw water. Most of these special studies were initiated because of fish and wildlife and water quality concerns held by agencies that provide domestic water service.

Water Quality Monitoring in the SWP

DWR's Division of Operations and Maintenance (O&M) monitors water quality throughout the SWP at more than 40 stations and analyzes more than 200 different chemical, biological, and physical constituents. O&M operates water quality monitoring stations at SWP storage and conveyance facilities located throughout the State, ranging from the Feather River watershed in the north to Lake Perris in the south. Conveyance facilities include the Oroville Facilities, California Aqueduct with the East and West Branches, North Bay Aqueduct, South Bay Aqueduct, and the San Luis Joint-Use Complex. O&M collects and analyzes samples monthly at most stations; however, sampling frequency may vary from weekly to annually depending on location, time of year, or special events. O&M delivers the water samples to DWR's Bryte Chemical Laboratory in West Sacramento for processing and analysis. Constituents analyzed include: dissolved solids; nutrients; minerals such as chloride, sulfate, and

sodium; trace elements; herbicides; pesticides; and organic substances.

O&M's water quality monitoring program also uses a network of 16 automated monitoring stations at key locations along the SWP. This network provides real-time data by continuously monitoring a variety of physicochemical parameters such as conductivity, turbidity, pH, UV₂₅₄ (254 nanometer ultraviolet absorbance; measures dissolved organic carbon [DOC]), and algal fluorescence. SWP water contractors rely on this essential data to assure safe drinking water.

O&M's water quality monitoring program is an integral component of SWP operations. O&M uses the data generated to assess water quality changes in the SWP, short- and long-term trends, and impacts from emergencies such as spills and pipe ruptures. O&M also uses the data to influence operations and hydrology, and to determine the general suitability of water for drinking as defined by public health protection standards. The findings are periodically assessed and disseminated through a variety of media including memos, network postings, conference calls, and email distribution. O&M periodically conducts special studies to investigate the impacts of specific incidents affecting SWP water quality. The special studies include groundwater turn-ins, floodwater inflows, hydrology, and Delta hydrodynamics. O&M posts a number of reports on DWR's website.

In 2011, overall SWP water quality constituent values were within historical ranges. Table 4-1 shows mean water quality for several sampling stations around the SWP and one station on the CVP's Delta-Mendota Canal. Average specific conductance (measured as EC) ranged from 79 microsiemens per centimeter ($\mu\text{S}/\text{cm}$) at Thermalito to 357 $\mu\text{S}/\text{cm}$ at North Bay Aqueduct. EC concentrations averaged between 229 to 320 $\mu\text{S}/\text{cm}$ in the California

Aqueduct and Delta-Mendota Canal. DOC was highest at the North Bay Aqueduct, at 7.1 mg/L, while concentrations in the California Aqueduct ranged from 2.4 to 4.2 mg/L. North Bay Aqueduct water exhibited higher levels of turbidity (an average of 24 NTU [nephelometric turbidity units]) compared to other locations. Water quality in the Oroville Facilities only recorded nondetectable to low levels of minerals, nutrients, and most minor elements. Alkalinity, specific conductance, and total dissolved solids concentrations in the Oroville facilities at Thermalito Afterbay averaged 37 mg/L, 79 $\mu\text{S}/\text{cm}$, and 48 mg/L, respectively.

O&M sampled for pesticides, herbicides, and insecticides in March, June, and September 2011 (see Table 4-2). Analyses of these organic compounds provided information on potential SWP exposure to contaminants. Staff detected low concentrations of the organophosphate insecticide chlorpyrifos (used to control foliage and soil-borne insect pests on a variety of food and feed crops) and the pesticides diuron, metolachlor, and simazine at the North Bay Aqueduct, Delta-Mendota Canal, Banks Pumping Plant, Check 13, Check 21, Check 29, Check 41, Devil Canyon, and Devil Canyon 2nd Afterbay.

Of the four detected organic chemicals, diuron had the highest concentration of 6.2 $\mu\text{g}/\text{L}$, followed by metolachlor, simazine, and chlorpyrifos with 0.3 $\mu\text{g}/\text{L}$, 0.07 $\mu\text{g}/\text{L}$ and 0.05 $\mu\text{g}/\text{L}$, respectively. The concentrations of the detected organic chemicals ranged from 0.02 to 0.62 $\mu\text{g}/\text{L}$.

Groundwater Turn-ins

Groundwater turn-ins to the California Aqueduct are authorized during periods of drought or reduced SWP allocations. SWP water contractors or other participants of an approved program convey groundwater into the California Aqueduct at various

Table 4-1 Mean Water Quality at Selected SWP Grab Sample Locations^a in 2011

Constituent	Units ^b	Reporting Limit	California Aqueduct

^a A grab sample is a single sample chosen to represent the conditions in a given matrix (usually natural water) at a specific location, depth, and time. All reported constituents are the yearly mean of laboratory analytical values sampled monthly from January through December. The yearly mean may be based upon one to twelve samples for the list of constituents.

^b mg/L = milligrams per liter; µS/cm = microsiemens per centimeter; NTU = nephelometric turbidity unit; NR = No data recorded at this location.

^c Devil Canyon Headworks, KA041134 was the sampling site during the period of January through March 2011, and the reported values are the means of those three months.

^d Devil Canyon 2nd Afterbay, KA041323 was the sampling site during the period of April through December 2011, and the reported values are the means of those nine months.

Table 4-2 Pesticides, Herbicides, and Other Organic Substances Detected in the SWP in 2011

^a Water at these locations was sampled during March, June, and September.

^b Only chemicals found in detectable amounts at the sampling stations are included in this table. No chemicals were detected in September. Refer to the document entitled *Analytical Methods for Organic Chemicals* for a complete listing of all organic chemicals included in the laboratory analysis. The document is available online on DWR's website.

^c µg/L = micrograms per liter.

locations. This water may be used for local redistribution or transfer to other water contractors. Groundwater turn-ins are allowed provided they do not result in the degradation of SWP water quality, cause toxicity to fish and wildlife, or adversely affect beneficial uses.

In 2001, DWR established interim two-tiered criteria for reviewing the water quality of groundwater turn-ins. Tier 1 programs have a "no adverse impact" criterion and are tied to historical water quality levels in California. Programs meeting Tier 1 criteria are generally approved by DWR without referral to the State Water Contractor Facilitation Group. Tier 2 programs involve

water quality levels that exceed the historical water quality in the California Aqueduct and have the potential to cause adverse impacts to the SWP water contractors. Tier 2 programs are referred to the State Water Contractor Facilitation Group for review and recommendations to DWR. DWR considers all factors before making a decision on a proposed groundwater turn-in program.

During 2011, approximately 69,000 acre-feet (af) of groundwater was pumped into the California Aqueduct. The majority of the groundwater turn-ins was from Tier 2 sources in the south San Joaquin Valley (San Joaquin Field Division). The sources were Kern Water Bank Authority (29,041 af), Cross Valley Canal (23,759 af), and Arvin-Edison Water Storage District (16,065 af). The groundwater pumped into the aqueduct did not degrade SWP water quality.

Additional SWP water quality data are available on DWR's website.

Non-project Floodwater Inflows

In 2011, floodwater inflows into the California Aqueduct occurred from January 2011 to June 2011, totaling 7,855 af. Floodwater inflows into the California Aqueduct from the Cantua Creek watershed can affect California Aqueduct water quality because the floodwater can deposit sediments, asbestos, and trace elements such as selenium. These elements naturally exist in the rugged terrain of this watershed and have been documented to cause water quality degradation in downstream areas. However, the floodwater inflow volumes in 2011 were very small compared to the California Aqueduct flow volumes for the specified months.

Municipal Water Quality Program Branch

The Sacramento-San Joaquin Delta provides drinking water for more than 25 million

people in California. The Division of Environmental Services, Municipal Water Quality Program (MWQP) is responsible for evaluating the suitability of Delta water as a drinking water source, identifying sources of water quality degradation, and ensuring water quality data meet quality assurance and quality control objectives. The MWQP Branch includes the Municipal Water Quality Investigations (MWQI) Program (MWQI Section, Field Support Section, Water Quality Special Studies Section, Real Time Data and Forecasting Comprehensive Program) and the Quality Assurance/Quality Control (QA/QC) Section.

The mission of the MWQI Program is to:

- support the effective and efficient use of the SWP as a source water supply used for municipal purposes through monitoring, forecasting, and reporting SWP water quality;
- provide early warning of changing conditions in source water quality used for municipal purposes;
- provide data and knowledge-based support for operational decision-making on the SWP;
- conduct scientific studies of importance to drinking water; and
- provide scientific support to DWR, the State Water Project Contractors Authority-MWQI Specific Project Committee, CALFED, and other governmental entities.

Real Time Data and Forecasting Comprehensive Program

The Real Time Data and Forecasting Comprehensive Program (RTDF-CP) has become a central element of the MWQP. The goal of the program is to further develop the capability for real-time data and forecasting of short- and long-term source drinking water quality conditions in the Delta and

SWP. Within the MWQP, the RTDF-CP entails the following elements:

- real-time monitoring conducted at key locations, providing stakeholders and interested parties with timely data;
- field operations that ensure proper operation of all automated sampling equipment;
- consistent modeling with continuous updates providing the best forecasts possible;
- QA/QC of the instruments and data; and
- centralized information management and dissemination.

The real-time monitoring network now includes stations located at Banks Pumping Plant, Jones Pumping Plant, the Sacramento River at Hood, and the San Joaquin River near Vernalis (McCune Station). MWQP is constructing a fifth station at the Gianelli Pumping-Generating Plant at San Luis Reservoir.

The RTDF-CP worked with several other agencies to develop a Delta spill early-warning model and alert system. This enables Delta water users to receive early warning of spills or sewage overflows, estimating concentration and arrival time.

Quality Assurance/Quality Control

The QA/QC Program was established by Water Resources Engineering Memorandum No. 60 in 1992 to ensure that data generated by DWR's environmental monitoring programs meet high quality standards and are scientifically defensible. This is accomplished by encouraging monitoring programs to follow standardized procedures including quality control measurements in their sampling protocols.

The program performs the following functions:

- procures specialized products and services from outside sources on an as-needed basis, which may include obtaining certified laboratory standards and outside instructors for teaching technical classes;
- publishes QA/QC guidance documents;
- develops and maintains the drinking water quality database and associated quality control metadata as part of the DWR Water Data Library; and
- assists departmental programs with developing QA project plans.

The QA/QC Program, with assistance from California State University, Sacramento, presented a class open to all DWR staff titled, "Quality Assurance for Water Quality Monitoring," on April 27–28, 2011. The class was aimed at project managers and field technicians involved in planning and conducting field water quality monitoring activities. The class provided tools and resources to integrate QA/QC procedures into a project's planning and data collection processes as required under Water Resources Engineering Memorandum No. 60.

QA/QC staff assisted the MWQP in finalizing QA project plans for two projects that evaluated impacts of the main regional wastewater treatment plants on water quality in the Delta. Samples were collected at the outfalls of the Sacramento Regional County Sanitation District and the City of Stockton Regional Wastewater Control Facility and were analyzed for nitrosamine precursors, which are emerging contaminants of concern, and also for pathogenic protozoa (*Cryptosporidium* and *Giardia*) that can cause serious human infections. QA project plans provide formal procedures for planning and conducting a water quality sampling project to document that QC protocols have been followed.

QA/QC staff continued improving the Field and Laboratory Information System, a database that provides a systematic way of collecting and storing QC metadata for DWR's environmental sampling programs and also monitors and stores analytical results within DWR's Bryte Chemical Laboratory. In 2011, staff consolidated field modules of the Field and Laboratory Information System that previously stored data at DWR's field offices into a single departmentwide, centralized database located at headquarters. This has reduced maintenance costs and improved QC data integrity.

Water Quality Special Studies

Special studies are conducted to investigate the origins, fate, transport, and in some cases loads of current and emerging contaminants of concern. Such studies help determine where new instruments should be located. Special studies can also be used to:

- investigate seasonal patterns and trends of constituents or examine circulation patterns of contaminants;
- refine modeling assumptions; and
- assess the impacts of increasing urbanization on levels of water quality constituents of concern.

MWQI engages in special studies that focus on specific aspects of source waters, contaminant loading, measurement methods and instrumentation, and climate and hydrology. The following studies were in progress during the 2011 calendar year:

- Urban Sources and Loads Investigation of Lathrop, California;
- Nitrosamines, their Precursors, and *Cryptosporidium*/*Giardia* Occurrence from Waste Water Treatment Plant Facilities in the Delta;
- investigation of O'Neill Forebay water circulation;

- investigation of constituent dispersion and travel time in the SWP;
- monitoring of the upstream Sacramento River for the Systech Watershed Analysis Risk Management Framework model;
- spectrofluorometer study;
- feasibility study for portable water quality monitoring station;
- MWQI Program Summary Report; and
- 2006–2010 State Water Project Sanitary Survey Update.

Accomplishments for the 2010–2011 MWQI Work Plan

During the 2010–2011 work plan cycle, the MWQI accomplished the following goals:

- continued improvements to the RTDF-CP website, which provides real-time, near real-time, and forecasted water quality data;
- implementation of the Delta Simulation Model 2 (DSM2) Aqueduct Extension Model of the SWP (Aqueduct Model) to provide seasonal forecasts;
- completion of a multiyear management plan for the forecasting component of the RTDF-CP;
- completion of DOC sampling for the DSM2 boundary improvement/model calibration special study (the report was included in the annual modeling report published by the Bay-Delta Office, and data from this study is now being used by both DWR and outside consultants on various modeling studies);
- installation of a Metrohm anion analyzer at the Jones Pumping Plant (publication of data to the California Data Exchange Center began in March 2011); and
- production of several projects to develop data for simulation of historical conditions for the Delta and Aqueduct models, including assembling, synthesizing, and refining EC, DOC, and bromide data necessary to define boundary conditions. These projects are

part of a large RTDF-CP water quality forecast project involving the Bay-Delta Office and SWP Operations Control Office.

The study report and other MWQP publications can be found on DWR's website.

Bryte Chemical Laboratory

Established in 1951, Bryte Chemical Laboratory is DWR's primary analytical laboratory. Its main function is to analyze drinking, surface, waste, and ground water for the various water quality programs within DWR. Since 1990, the laboratory has been certified biannually by the CDPH Environmental Laboratory Accreditation Program to perform water quality analyses following U.S. Environmental Protection Agency (EPA) or American Water Works Association procedures and analytical methods. This certification allows the laboratory to perform analyses for regulatory work that can be used for compliance purposes. The laboratory continues to perform the vast majority of chemical and other related analyses required to support DWR's water quality programs. Each year, thousands of water samples are routinely analyzed for inorganic and organic constituents such as standard minerals, cations, anions, nutrients, metals, chlorophyll, pesticides, herbicides, and volatile organic compounds.

In 2011, the laboratory upgraded its capability and capacity to detect and analyze cations (sodium, calcium, potassium, magnesium, boron, and silica) following EPA Method 200.7 with the purchase of a PerkinElmer Optima 8300 inductively coupled plasma optical spectrophotometer. The spectrophotometer is a fully automated and computer-controlled instrument equipped with new, technologically advanced optics and two solid-state, segmented-array, charge-coupled device detectors that generates data that are highly stable, accurate, and reproducible.

The instrument's detection limit has been established at 1 part per million.

The laboratory has continued to manage a variety of analytical contracts with other State agencies and several outside laboratories in accordance with the master contract policy approved in fiscal year 1994–1995. These contracts are used to perform analyses that are beyond the capability and capacity of the laboratory, such as solids and fish tissues. The laboratory works in conjunction with DWR's MWQP QA/QC Section to replace these contracts as they expire each fiscal year. On September 29, 2011, Weck Laboratories, Inc. was awarded the contract for water analysis worth \$1.5 million over 3 years.

SWP security and protection has continued to be a primary goal for DWR since September 11, 2001. To help protect the SWP from biochemical and chemical agents, the laboratory continues to be an active member in a group of laboratories called the California Association of Mutual Aid Laboratories Network (CAMAL Net) headed by CDPH. The laboratory network's main objective is to voluntarily assist CDPH in the analysis of chemical agents in water quality samples should a natural disaster or biochemical or chemical event occur in California. The assistance is only required should the analytical capacity of CDPH be exceeded or to confirm the presence or absence of chemical agents in water quality samples provided by CDPH. In 2007, Bryte Chemical Laboratory was classified as a Level II participating laboratory in the CAMAL Net organization. Level II only allows the laboratory to receive samples that are prescreened and determined nonhazardous to laboratory personnel.

Suisun Marsh Activities

Suisun Marsh consists of approximately 59,000 acres of tidal and managed brackish water wetlands and 30,000 acres of bays and

sloughs. It is the largest contiguous brackish marsh remaining in the United States. Situated in southern Solano County, west of the Sacramento-San Joaquin Delta and north of Suisun Bay, the marsh encompasses more than 10 percent of California's remaining natural wetlands. The marsh is the resting and feeding ground for thousands of waterfowl and shorebirds migrating on the Pacific Flyway. It provides important habitat for more than 221 bird species, 45 mammal species, 16 reptile and amphibian species, and more than 40 fish species.

DWR became intricately involved in the Suisun Marsh in response to SWRCB Water Right Decision 1485, which required mitigation for effects of the SWP and CVP. The 1984 *Plan of Protection for Suisun Marsh*, completed by DWR, included a series of facilities to distribute lower salinity water to managed wetlands and monitoring in relation to these facilities. Today, DWR operates and maintains DWR/Reclamation water management facilities, including the Roaring River Slough Distribution System (RRSDS), Morrow Island Distribution System (MIDS), Goodyear Slough Outfall, and the Suisun Marsh Salinity Control Gates (SMSCG). Figure 4-2 shows the water quality compliance and monitoring sampling locations and the water management facilities.

Through agreements and plans, DWR has been working in coordination with Reclamation, DFW, Suisun Resource Conservation District (SRCD), USFWS, and other agencies on habitat management, preservation, and restoration of the Suisun Marsh.

Revised Suisun Marsh Preservation Agreement

In 1987, DWR, Reclamation, DFW, and SRCD signed the *Suisun Marsh Preservation Agreement* (SMPA). It required Reclamation and DWR to meet salinity standards as

specified in the then-current SWRCB Water Right Decision 1485, set a timeline for implementing the *Plan of Protection for the Suisun Marsh*, and delineated monitoring and mitigation requirements. A revised SMPA and *Revised Mitigation and Monitoring Agreement* were signed in 2005 to make channel water salinity requirements consistent with D-1641. These included management activities in lieu of western marsh facilities proposed in the plan of protection.

The revised SMPA included the following actions: operate facilities in order to meet channel water salinity standards consistent with D-1641; implement a Water Manager Program; provide portable pumps; update Individual Ownership Adaptive Management Habitat Plans; establish a Drought Response Fund; and replace turnouts on the RRSDS. The monitoring agreement included monitoring for fish, the salt marsh harvest mouse, vegetation, and other biological monitoring.

During 2011, DWR, DFW, Reclamation, and SRCD continued to implement these activities.

Operation and Maintenance *Morrow Island Distribution System Fish Screen and Alternatives*

MIDS is an interior ditch bordered by levees that was created to distribute water to managed wetlands. Water with relatively lower salinity is taken from Goodyear Slough in the west through water control structures that transport the water into MIDS. Water is then distributed to managed wetlands through private landowner water control structures along the ditch. Water not used by the landowners exits into Grizzly Bay through water control structures in the east.

Based on previous study results, a fish screen at MIDS would likely have negligible benefits to sensitive fish populations (see

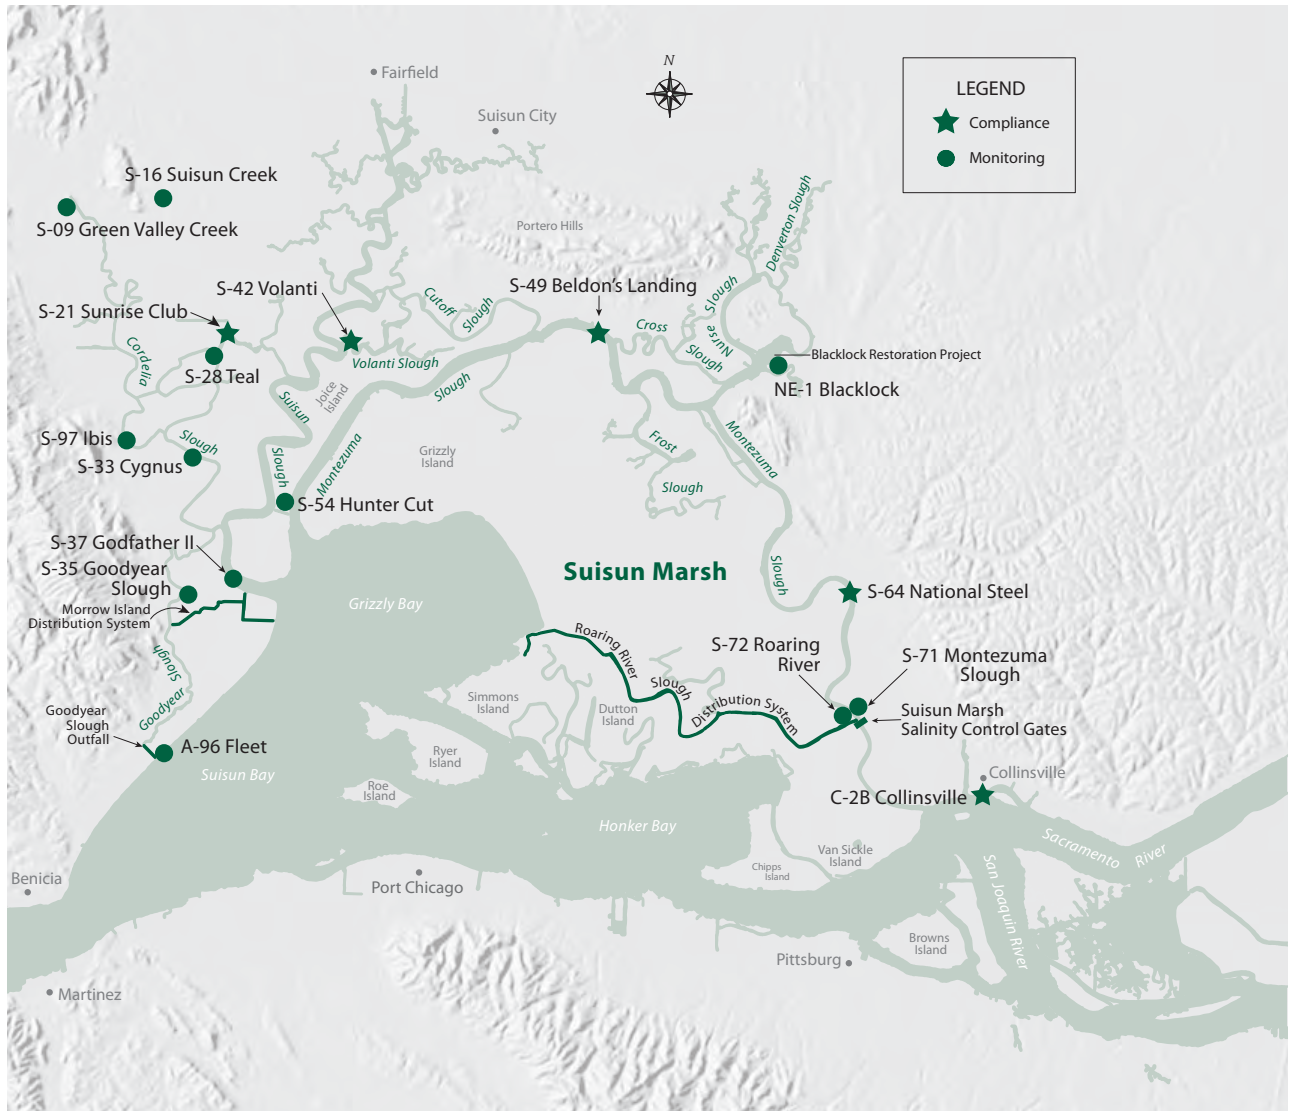

Figure 4-2 Compliance and Monitoring Stations and Water Management Facilities in the Suisun Marsh

Bulletin 132-07, Chapter 4, Water Quality). DWR and Reclamation are proposing to fulfill the outstanding terms and conditions of the USFWS 1997 BO for the MIDS maintenance project by acquiring and protecting, in perpetuity, aquatic habitat in Suisun Marsh. (For additional information about the BO, see Bulletin 132-08.) The status of this proposal remains on-going without new notable developments or changes.

On February 23, 2009, DFW issued an incidental take permit for the on-going and

long-term operation of existing SWP facilities in the Sacramento-San Joaquin Delta for the protection of Longfin Smelt. MIDS is included as one of these facilities.

To minimize the take of Longfin Smelt at the MIDS diversion, DFW specifies the average intake velocities each year in order to adequately protect these fish.

Also, as a requirement of the incidental take permit, DWR is developing a study to confirm that the aforementioned operation prevents

or substantially reduces the entrainment of Longfin Smelt at MIDS.

Suisun Marsh Salinity Control Gates

The SMSCG are operated as needed to meet salinity standards. When they are not in operation, they are placed in an open position to minimize fish concerns related to predation and impedance. In the past, installation or removal of the flashboards and operation of the gates has varied due to salinity conditions, fisheries agencies' requests for sensitive species concerns, or special studies and repairs.

Status of SMSCG in 2010–2011. During the control season (October 2010 through May 2011), the flashboards were installed October 12, 2010, with the three radial gates in the open position and the boat lock gates open as required in the National Marine Fisheries Service agreement for fish passage. The SMSCG were tidally operated between November 16 and December 7, 2010, due to salinity concerns in the marsh. On start-up on November 16, only gate number 1 started operating remotely. Gates number 2 and number 3 experienced electrical problems and stayed in the open position until November 25 when they were closed. Gate number 2 became operational on November 30. Gate number 3 remained closed until repaired on February 2, 2011, when it was set in the open position. Due to high outflows in December, gate operations were suspended on December 8, 2010. Salinity levels continued to stay low in January and February, and with a series of storm events in March, salinity levels decreased well below the monthly standards for April and May. The flashboards were removed on May 18, 2011. In 2011, two of the boat lock gates were refurbished.

Other Facility Operation and Maintenance

The RRSDS and Goodyear Slough Outfall were operated and maintained as needed

to provide lower salinity water to managed wetland properties.

Water Quality and Compliance

Salinity levels for the 2010–2011 control season were below monthly standards for all five compliance stations.

Details of salinity levels in the marsh are available in the monthly report entitled, *Suisun Marsh Monitoring Program Channel Water Salinity Report*, available on DWR's website.

Blacklock Tidal Marsh Restoration Project

DWR received CALFED Ecosystem Restoration Program grant funds in 2001 to acquire the 70-acre Blacklock property in December 2003. DWR, in cooperation with Reclamation, DFW, USFWS, and SRCD, implemented the Blacklock Restoration Project (location shown on Figure 4-2). This project restored diked, managed wetlands to tidal wetlands. Although a natural breach in the levee occurred in July 2006, it was determined that the planned breach should still be constructed to allow for full tidal flow and optimum sediment transportation. The planned breach construction occurred on October 3 and 4, 2006.

The project goals and objectives are to:

- restore the area to a fully functioning, self-sustaining marsh ecosystem created through restoration of natural hydrologic, sedimentation, and biological processes;
- increase the area and contiguity of emergent wetlands providing habitat for tidal marsh species; and
- assist in the recovery of at-risk species.

The final restoration plan for the project was published in June 2007.

In 2011, DWR continued implementing the 10-year monitoring program at the Blacklock site. Monitoring is performed in cooperation with State and federal agencies. There are 15 parameters being monitored, including sediment accretion, channel network evolution, vegetation development, water quality, methylmercury concentrations, and avian use.

For more information about the Blacklock Restoration Project, visit the Suisun Marsh Program webpage on DWR's website.

Suisun Marsh Habitat Management, Preservation, and Restoration Plan

The *Suisun Marsh Habitat Management, Preservation, and Restoration Plan*, referred to as the Suisun Marsh Plan (SMP), was developed by the Principal Agencies (or Principals), a group of agencies with primary responsibility for Suisun Marsh management. The SMP is intended to balance the benefits of tidal wetland restoration with other habitat uses in the marsh by evaluating alternatives that provide a politically acceptable change in marshwide land uses, such as salt marsh harvest mouse habitat, managed wetlands public use, and upland habitat. It relies on the incorporation of existing science and information developed through adaptive management.

The Principals include USFWS, Reclamation, DFW, DWR, National Marine Fisheries Service, and SRCD. The Principals have consulted with other participating agencies, such as the U.S. Army Corps of Engineers, San Francisco Bay Conservation and Development Commission, the RWQCBs, and SWRCB to develop this plan.

During 2011, the SMP was completed. Representatives from the Principals met monthly to finalize actions and alternatives to be included in the SMP. The SMP environmental impact statement/environmental impact report was developed

in coordination with the recommendations of the Delta Vision Process and with information and evaluation provided by the Delta Risk Management Study and other regional programmatic processes. Reclamation and USFWS served as joint National Environmental Policy Act lead agencies, and DFW served as the California Environmental Quality Act lead agency. An adaptive management plan will be implemented as a component of the SMP. The final environmental impact statement/environmental impact report was completed in November 2011 and is available on the U.S. Department of the Interior website.

Suisun Marsh Expenditure History

Suisun Marsh expenditures and reimbursements administered by DWR for calendar years 1968 through 2011 are summarized in Table 4-3. From 1968 through December 31, 2011, DWR disbursed more than \$138.7 million of SWP funds for planning, design, environmental documentation, construction, maintenance, monitoring, mitigation, and permit compliance in support of implementing the *Plan of Protection for the Suisun Marsh* through the SMPA and for meeting standards set by SWRCB. Reclamation has reimbursed DWR approximately \$52.8 million (38 percent), and the State's General Fund has reimbursed approximately \$9.5 million (7 percent). These figures do not include up-front payments made by Reclamation for staff and other direct costs, as well as approximately \$5.7 million in Reclamation interest payments during 1988 and 1989.

Annual figures are reported in Table 4-3 for DWR's up-front payments, Reclamation reimbursements, General Fund reimbursements, and DWR's cumulative expenditure balance.

Table 4-3 Suisun Marsh Expenditures and Reimbursements Administered by DWR (in dollars), 1968–2011

^a Under Assembly Bill 1442, the General Fund paid 20 percent of the Suisun Marsh costs through June 1988, which totaled \$9,478,000. This payment included \$2,843,400, which represents 7 percent of the costs through June 1988 paid by the General Fund. This amount has reduced the costs billed to the SWP water contractors. The remaining \$6,634,600 received from the General Fund represents DWR's recreation project purpose share of 14 percent.

^b Excludes interest payments made by Reclamation in 1988 and 1989.

^c Allocation factors for capital recreation costs have changed from 14 percent to 3.4 percent, and operations and maintenance recreation costs from 14 percent to 3.3 percent.

Chapter 5 Local Assistance

The California Irrigation Management Information System weather stations help growers and landscape managers determine when to irrigate and how much water to apply.

Significant Events in 2011

The California Irrigation Management Information System (CIMIS) made significant improvements to data quality and availability in support of the Water Conservation Act of 2009 (Senate Bill [SB]X7 7) and the Model Water Efficient Landscape Ordinance (MWELO).

The Recycling and Water Desalination Section contributed information for various components of SBX7 7, including assessing how to determine reasonable 2020 and 2030 targets for statewide water recycling; brackish groundwater desalination and infiltration; and direct use of urban storm water runoff.

The Department of Water Resources (DWR) continued working with the Agricultural Stakeholder Committee (ASC) to seek technical and policy input from stakeholder representatives and the public as it plans and implements the requirements for developing the Agricultural Water Measurement regulations and implementing other agricultural provisions and mandates of SBX7 7.

DWR convened an Urban Stakeholder Committee to provide guidance and input. DWR also began to develop a fourth target method and the industrial process water regulation.

Through the Integrated Regional Water Management (IRWM) Grant Program, DWR awarded \$21 million in planning grant funding, \$205 million in implementation grant funding, and \$178 million in stormwater flood management grant funding in 2011.

Information in this chapter was contributed by the Division of Statewide Integrated Water Management, the Division of Environmental Services, and the Division of Integrated Regional Water Management.

The Department of Water Resources (DWR) manages the Davis-Grunsky Act Program, water use efficiency, agricultural drainage, and Water Conservation Bond Law programs, and participates in several other programs that assist local agencies and benefit State Water Project (SWP) water contractors.

Davis-Grunsky Act Program

The Davis-Grunsky Act, authorized in 1960 as part of the Burns-Porter Act, provides construction loans for local domestic water projects and agricultural water supply. It also provides grants for recreation and fish and wildlife enhancement. Additionally, loans and grants may be given to rehabilitate dams and reservoirs.

DWR's ongoing administration of Davis-Grunsky program loans and grants includes management and oversight of 32 recreation projects and contracts. Administration costs are recovered from revenues generated by repayment of Davis-Grunsky Act loans. Recreation grant contracts are being amended to reflect modification of DWR's fee oversight functions and actual construction of recreation facilities.

The Davis-Grunsky Act requires participating State agencies to operate and maintain the recreation projects, while DWR inspects the recreation facilities, monitors the recreation contracts, and maintains a list of the recreation projects.

Water Use Efficiency

The Water Use and Efficiency Branch in the Division of Statewide Integrated Water Management activities include providing technical assistance to local agencies; managing water use efficiency financial assistance programs; managing the California Irrigation Management Information System (CIMIS); reviewing,

tracking, and reporting on urban and agricultural water management plans; and managing drainage and water recycling/desalination projects.

California Irrigation Management Information System

CIMIS is a network of automated weather stations that collects weather data and transmits it to a central repository in Sacramento. After performing quality control and calculations, data are made available to the public for such diverse purposes as irrigation scheduling, resource planning, research, and modeling.

In 2011, DWR's CIMIS network collected data from 145 stations, with approximately 58 percent of the stations on the network belonging to local cooperators. The demand for CIMIS data has been increasing steadily since its establishment in 1982. In 2011, the number of registered data users had grown from 661 in 1989, to more than 39,800.

Approximately 2.1 million reports were generated from the database using the CIMIS website in 2011. Thousands of reports were also retrieved from the CIMIS FTP (File Transfer Protocol) site. Users can register online, access archived data, download data files, and peruse content about the CIMIS program and other helpful metadata and information. A separate but concurrently operating database and web application is maintained for redundancy to protect the data.

CIMIS continued providing the spatially distributed reference evapotranspiration (ET₀) data, known as Spatial CIMIS, and expanded its user base through outreach activities. Spatial CIMIS is produced by coupling remotely sensed data from the National Oceanic and Atmospheric Administration's Geostationary Operational Environmental Satellite with point measurements from CIMIS stations to estimate ET₀ data at 2-kilometer grids.

In addition to increasing the number of its stations, CIMIS made significant improvements to data quality and availability in support of the Water Conservation Act of 2009 (Senate Bill [SB]X7 7), and the Model Water Efficient Landscape Ordinance (MWELO). SBX7 7 requires all water suppliers to increase water use efficiency. It also requires, among other things, the development of agricultural water management plans and a 20 percent reduction in urban water consumption by the year 2020.

In 2011, CIMIS continued working on multiple projects initiated in 2010 to upgrade its hardware and software to accommodate the anticipated increase in demand for data for implementation of SBX7 7 and MWELO. When completed, these projects are expected to deliver better-quality CIMIS data more frequently, using user-friendly features.

Recycling and Water Desalination

The goal of the Division of Statewide Integrated Water Management's Recycling and Water Desalination Section is to improve water use efficiency by promoting increased use of nonconventional water sources—namely recycled water and desalinated brackish and ocean waters—through planning, technical, and financial assistance. As part of a balanced water portfolio, nonconventional water sources will help meet existing and future water supply and environmental needs. The section's

mission consists of increasing safe and beneficial use of recycled water, advancing energy-efficient treatment and desalination technologies, and encouraging economically and environmentally acceptable use of desalinated brackish and ocean waters.

In 2011, Recycling and Water Desalination Section activities included the following:

- contributing timely water recycling information for various components of SBX7 7, including assessing how to determine reasonable 2020 and 2030 targets for statewide water recycling, brackish groundwater desalination, infiltration and direct use of urban stormwater runoff, and providing desalination information;
- continuing to develop new knowledge on water recycling and desalination activities and projects in California;
- continuing to manage grant agreements for 30 of the original 48 desalination projects awarded in the first two cycles of the Proposition 50 desalination grant program. The active projects include: 11 research and development projects, 12 demonstration and pilot projects, 4 feasibility studies, and 3 construction projects;
- continuing to provide technical knowledge on water recycling and water desalination issues, including responses to questions from policymakers, regulators, State and local agencies, and the public on permitting issues; public health regulations; types, locations, and amounts of water reuse occurring; and desalinated water production and use; and
- making presentations about California's water recycling and desalination activities to DWR's visitors.

Proposition 50 Water Use Efficiency Grant Program

Proposition 50 has provided approximately \$105 million for the Water Use Efficiency grant program since 2005. The grant program provided funds for implementation of all urban best management practices and agricultural efficient water management practices (EWMPs) that would result in local, regional, and statewide benefits. The State benefits are water conservation, flow and timing, water quality, and energy, among others.

A competitive proposal solicitation package was developed for all grant cycles, along with a comprehensive review and evaluation of the project proposals. The proposal solicitation package defines project benefits, eligible projects, eligible applicants, funding caps, reporting, and other contract requirements.

In 2011, the Water Use Efficiency grant program continued to manage close to 150 grant agreements from previous proposal solicitations, the last of which was the Drought Assistance Proposal Solicitation that resulted in awarding 53 grants in the summer of 2008. Several of those grant agreements were executed after the State's "Stop Work" order was lifted in 2010.

In preparation for the release of a new round of funding targeting agricultural water use efficiency projects, \$15 million of Proposition 50 funds were reappropriated in 2011.

Agricultural Water Management Plans

SBX7 7, the Water Conservation Act of 2009 required all water suppliers to increase water use efficiency. Agricultural water suppliers are responsible for preparing, implementing, and updating agricultural water management plans, measuring the volume of water

delivered to customers, adopting a pricing structure, and implementing efficient water management practices. Agricultural water suppliers who fail to meet the specified water management planning requirements will not be eligible for water grants or loans awarded or administered by the State.

DWR and the Agricultural Water Management Council established the Agricultural Stakeholder Committee (ASC) to help DWR implement provisions of SBX7 7. Through a public process, the ASC will review technical materials and documents and provide comments, data, and supporting information to DWR. Meetings of the ASC and its subcommittees occurred throughout 2011.

SBX7 7 established the Agricultural Water Management Planning Act (California Water Code [CWC] Section 10800, et seq.) requiring an agricultural water supplier to prepare and adopt an Agricultural Water Management Plan (AWMP) on or before December 31, 2012. The agricultural water supplier is then required to update its AWMP on December 31, 2015, and every 5 years thereafter.

"Agricultural water supplier" is defined as a publicly or privately owned water supplier that provides water to 10,000 or more irrigated acres, excluding acreage that receives recycled water. An agricultural water supplier is a supplier of or contractor for water that distributes or sells water for resale. Every water supplier that becomes an agricultural water supplier after December 31, 2012, is responsible for preparing and adopting an AWMP within one year of becoming an agricultural water supplier. Agricultural water suppliers that provide water to less than 25,000 irrigated acres, excluding recycled water, are not required to adopt and implement an AWMP unless sufficient funding has specifically been provided for these purposes.

In 2011, DWR began development of a draft *Agricultural Water Management Plan Guidebook*. The guidebook will assist agricultural water suppliers in understanding and complying with the requirements of SBX7 7. It includes detailed information about preparing and submitting an AWMP to DWR.

SBX7 7 requires DWR (in consultation with the State Water Resources Control Board [SWRCB]) to promote implementation of regional water resources management practices through increased incentives and removal of barriers, consistent with State and federal law. It allows potential for revisions to the requirements for agricultural water management plans, eligibility requirements for grants and loans, permitting requirements, funding for research, and technical support.

Agricultural Water Measurement Regulation

SBX7 7 identified two critical efficient management practices that agricultural water suppliers are required to implement: measure the volume of water delivered to customers with sufficient accuracy to comply with CWC Section 531.10(a), and adopt a pricing structure based at least in part on quantity delivered. It also specified numerous additional efficient management practices for agricultural water suppliers to consider for implementation.

SBX7 7 requires DWR to adopt regulations that specify options for agricultural water suppliers to comply with the water measurement requirement in CWC Section 106083.48(b)(1). The regulations would apply to agricultural water suppliers providing water to 25,000 irrigated acres or more. Suppliers providing water to 10,000 or more irrigated acres, but less than 25,000 irrigated acres are also subject to these regulations, if sufficient funding is provided for that purpose as stated in CWC Section 10853.

Agricultural water suppliers that are subject to the regulations must measure the volume of water pursuant to the accuracy standards defined in the regulations and submit that data in the annual report (required by CWC Section 531.10[a]) summarizing aggregated farm-gate delivery data.

SBX7 7 authorized DWR to initially adopt an emergency water measurement regulation. Through the emergency rulemaking process, DWR adopted an emergency agricultural water measurement regulation that was approved by the Office of Administrative Law and became immediately effective in July 2011. DWR then began the rulemaking process for adopting a permanent agricultural water measurement regulation.

Methodology for Quantification of Efficiency of Agricultural Water Use

SBX7 7 directed DWR—in consultation with the Agricultural Water Management Council, academic experts, and other stakeholders—to develop and report to the Legislature a proposed methodology for quantifying the efficiency of agricultural water use and a plan of implementation that includes estimated implementation costs, roles and responsibilities, and types of data that would be needed to support the methodology. DWR held numerous public meetings, stakeholder committee and subcommittee meetings, and public workshops to develop the methodology and prepare a report to the Legislature. Throughout 2011, the draft methodology was being developed, refined, and discussed with various stakeholders. The proposed methodology is intended to be used as a tool to help evaluate current conditions and plan for strategies for improving agricultural water management. The anticipated users of these methods are farmers, water suppliers, and regional water management groups, as well as nongovernmental organizations and local, State, federal, and tribal planners.

Urban Water Management Plans

SBX7 7 extended the deadline for urban water suppliers to submit urban water management plans from December 31, 2010, to August 1, 2011. DWR released the *Guidebook to Assist Urban Water Suppliers to Prepare a 2010 Urban Water Management Plan* in March of 2011. DWR held 10 urban water management planning workshops throughout the State in February and March 2011. Water suppliers submitted 371 plans to DWR in 2011. DWR began its review of the plans. Data from the plans was entered into a new DWR Online Submittal Tool.

SBX7 7

SBX7 7, the Water Conservation Act of 2009, directed DWR to be the lead agency in implementing a number of separate actions required by the law:

- consult with the: California Urban Water Conservation Council, Agricultural Water Management Council, California Public Utilities Commission, California Department of Public Health, California Bay-Delta Authority (CBDA) or its successor agency, and the SWRCB on various parts of the legislation;
- develop regulations for commercial, industrial, and institutional (CII) process water;
- develop regulations for industrial process water;
- convene a CII Task Force and develop alternative best management practices for CII;
- develop technical methodologies and criteria for urban water suppliers to set per capita baseline, target, and compliance water use;
- develop a fourth water use target method that cumulatively could result in a statewide 20 percent reduction in urban per capita water use considering certain flexibilities;

- report to the Legislature by the end of 2016, and make recommendations on needed changes if the State is not “on track” to meet per capita targets;
- promote implementation of regional water resources management practices;
- propose new, or review and update existing, statewide targets for regional water resources management practices, including recycled water, brackish groundwater desalination and infiltration, and direct use of urban stormwater runoff.

To implement these actions through a public process, DWR convened an Urban Stakeholder Committee to provide guidance and input. DWR also began to develop the fourth target method and the industrial process water regulation.

Assembly Bill 1420 Compliance

AB 1420 (Chapter 628, Statutes of 2007) amended the Urban Water Management Planning Act (CWC Section 10610 et seq.) and was effective January 1, 2009. AB 1420 requires that the terms of, and eligibility for, any water management grant or loan made to an urban water supplier and awarded or administered by DWR, SWRCB, or the CBDA or its successor agency (collectively referred to as “funding agencies”), be conditioned on the implementation of the water demand management measures described in the urban water management plan, as determined by DWR.

Water management grants and loans include programs and projects for surface water or groundwater storage, recycling, desalination, water conservation, water supply reliability, and water supply augmentation. This funding includes, but is not limited to, funds made available pursuant to Public Resources Code Section 75026 (the Integrated Regional Water Management Program).

AB 1420 required DWR to consult with SWRCB and the CBDA in the development of eligibility requirements that consider the California Urban Water Conservation Council's best management practices and alternative approaches that provide equal or greater water savings. In 2009, AB 1420 compliance criteria were released.

Agricultural Drainage Program

The Agricultural Drainage Program's mission is to seek in-valley solutions to the surface and subsurface agricultural drainage water problems, particularly in the San Joaquin Valley, and to improve water quality in the San Joaquin River. This will be accomplished by promoting newer technologies and management practices that can reduce or eliminate off-site discharge of saline water.

The San Joaquin Valley Drainage Implementation Program has been idle since 2003. However, DWR continues to implement many of its recommendations through its Agricultural Drainage Program. DWR works in partnership with California universities (University of California and California State University), the Bureau of Reclamation (Reclamation), resource conservation districts, watershed groups, water and drainage districts, and many other local, State, and federal entities. Program activities include:

- developing, educating, and promoting the use of Integrated On-Farm Regional Drainage Management systems in the San Joaquin Valley;
- providing technical assistance and collaborating with water and drainage districts and local entities to reduce and control surface and subsurface agricultural drainage water;
- maintaining research and demonstration projects to develop drainage reuse systems, including cost-effective,

salt-tolerant crops (including energy crops); drainage treatment; disposal technologies; and salt separation and utilization;

- monitoring the quality and distribution of shallow groundwater levels in drainage-impaired areas of the San Joaquin Valley;
- promoting agricultural water and energy-use efficiency programs in drainage-impaired lands to reduce the volume of surface and subsurface drainage water and expand regional water supplies;
- maintaining programs to help improve water quality in the San Joaquin River; and
- providing grants for control of agricultural drainage water and the reduction of its toxic elements, using Propositions 50, 84, 204, and DWR project funding.

The Agricultural Drainage Program is divided into two major activities: management of Proposition 204 (the Drainage Management Subaccount) and the San Joaquin Valley Agricultural Drainage Program.

Proposition 204 (Drainage Management Subaccount)

In 1996, Proposition 204, The Safe, Clean, Reliable Water Supply Act, authorized the transfer of approximately \$6.1 million from the SWRCB to the California Department of Food and Agriculture. In 1997, the California Department of Food and Agriculture, SWRCB, and DWR signed a memorandum of understanding that established a process for utilizing the funds designated for agricultural drainage water management activities. In 1999, the California Department of Food and Agriculture and DWR signed an interagency agreement to transfer the funds to DWR for developing and implementing programs consistent with CWC Section 78645, as outlined in the memorandum of understanding. The program's goal is to develop methods of

using and concentrating salts and reducing trace element contaminants in the State's subsurface agricultural drainage water.

When bond funds are available, DWR solicits proposals from public entities seeking funding for Proposition 204 eligible activities. A technical review committee screens the proposals. DWR submits the proposal packages to an oversight committee comprised of representatives from DWR, the California Department of Food and Agriculture, and SWRCB for final approval. Ultimately, DWR is responsible for preparing and managing contracts for the approved proposals. There were no solicitations for proposals in 2011.

San Joaquin Valley Agricultural Drainage Program

This program consists of several activities, including drainage monitoring and evaluation, drainage treatment, integrated on-farm drainage management, drainage reduction and reuse, environmental services, and the San Joaquin River Water Quality Improvement Program.

Drainage Monitoring and Evaluation

Drainage monitoring and evaluation provides information on the quality, quantity, and movement of drainage water. In 2011, the following activities were conducted:

- monitoring shallow groundwater levels and flows, and collecting water quality data for drainage water from west side San Joaquin Valley tile drain sumps;
- measuring groundwater levels quarterly for approximately 200 wells in Kern County;
- preparing shallow groundwater and irrigation methods maps of drainage-impaired areas using drainage monitoring data in conjunction with land use and irrigation methods data;
- providing assistance for the collection of groundwater, soil, and operational

data for the integrated on-farm drainage management project at Red Rock Ranch (RRR) in western Fresno County; and

- maintaining a website that includes information on drainage programs and activities, salinity and shallow groundwater maps, Proposition 204 grants, and links related to other agricultural drainage programs.

Drainage Treatment

Development of Membrane Treatment of Agricultural Drainage Water. DWR continues to fund research on the use of membrane treatment for desalting agricultural drainage water under a multiyear contract with the University of California, Los Angeles (UCLA). Two reverse osmosis desalination pilot studies have been proposed.

The first study involves cooperation with UCLA to test a nanofiltration unit coupled with a reverse osmosis unit. This unit would have proprietary sensors that allow the unit to monitor and modify online operating parameters based on changing conditions of the incoming drain water. This trial will determine the operating efficiency of the unit in terms of the percent of recovery compared to the amount of time it takes for membrane fouling, and determine the electrical and chemical costs of operating the unit.

The second, a reverse osmosis research study, involves cooperation with a commercial company interested in treating water for potable use. The company intends to use a reverse osmosis unit to treat drainage water or shallow brackish groundwater. The initial goals would be similar to the UCLA reverse osmosis study, except that the commercial trial would also investigate treatment of other drainage water constituents, such as nitrate and boron.

Grassland Area Farmers: Compliance with Water Quality Control Plan. DWR continues to participate in a multiagency cooperative effort with Grassland Area Farmers and

Reclamation to comply with the objectives of the Central Valley Regional Water Quality Control Board's *Water Quality Control Plan (Basin Plan) for the Sacramento River Basin and the San Joaquin River Basin*. One of the key components of the plan is drainage water treatment.

SWRCB approved the environmental impact report/environmental impact statement for the continuation of the *Grassland Bypass Project, 2010–2019*. The proposed actions are to:

- extend the San Luis Drain Use Agreement in order to allow the Grassland Basin Drainers time to acquire funds and develop feasible drain water treatment technology to meet revised Basin Plan objectives (amendment underway) and Waste Discharge Requirements by December 31, 2019;
- continue the separation of unusable agricultural drainage water discharged from the Grassland Drainage Area from wetland water supply conveyance channels for the period 2010–2019; and
- facilitate drainage management that maintains the viability of agriculture in the project area and promotes continuous improvement in water quality in the San Joaquin River.

Ion Exchange Pretreatment Investigations.

DWR continues to successfully operate a manually controlled ion-exchange system to “soften” agricultural drainage water. The small manually operated ion-exchange treatment system provided DWR with enough information to continue utilizing this treatment process on a larger scale. DWR solicited bids for a larger capacity automated ion-exchange system (10 gallons per minute) that would effectively remove hardness from agricultural drainage water. Producing “soft” drainage water reduces the need for cleaning or scale removal in other treatment technologies that DWR will test in the future. The future

treatment technologies will consist of electrocoagulation, vapor compression distillation, and reverse osmosis. Another benefit of ion exchange is that the regenerate will be utilized as a dust-control product in the form of calcium chloride and magnesium chloride.

Vapor Compression Distillation Investigation.

A vapor compression distillation unit was installed and operated on a limited basis during 2011. During the treatment process, “softened” drainage water is evaporated, converted to steam, and then condensed, resulting in distilled water and concentrated brine. The unit is expected to achieve a flow rate of 21 gallons per minute, and the expected ratio of distilled water to brine will be 80 percent to 20 percent. DWR will continue this investigation when an adequate and consistent source of supply water can be maintained at the project site. The preliminary investigation will determine the amount of energy required to operate the unit under differing flow ratios.

Agricultural Subsurface Drainage: Salt Recovery, Purification, and Utilization.

DWR continues to support investigations of processes for concentrating and purifying drainage salts for marketing purposes. The current technology that DWR is investigating is the electrochemical process. This process is a carbon dioxide-negative method that produces usable agricultural chemicals such as acids, bases, and carbonates as by-products.

Integrated On-Farm Drainage Management

DWR's South Central Region Office's Integrated On-Farm Drainage Management (IFDM) became a permanent activity when the Integrated Drainage Management Section was created in 2001. Its objective is to provide technical assistance on IFDM systems through advisory, technical, and oversight committees. IFDM is a drainage management system based on sequential

reuse of saline drainage water to irrigate crops of progressively increasing salt tolerance. Each sequential reuse reduces the volume of drainage water and increases the salt concentration. Drainage water too saline to irrigate crops is applied to solar evaporators, a management practice that SWRCB supports. The IFDM program funds, administers, and monitors contracts with State, federal, university, and local entities to learn more about IFDM systems. Findings indicate that IFDM systems have less significant environmental impacts than other options, and they reduce the volume of drainage water. The program is investigating the use of accelerated evaporation systems (solar evaporators) for zero-discharge systems.

IFDM program staff also:

- coordinate IFDM research activities and data collection with other agencies;
- assist growers and local agencies in planning and developing IFDM systems;
- provide assistance to research projects for the development of crops, including research being performed at RRR by California State University, Fresno, to assess the suitability of various salt-tolerant forages and halophytes for the sequential reuse of drainage water, forage quality, productivity, and water use;
- assist growers, water and drainage districts, and regional entities by providing information on salt-tolerant grasses and IFDM design specifications;
- assist SWRCB to develop policies for the management of drainage water, salt, and selenium; and
- improve enhanced evaporation features of the pilot solar evaporator.

DWR is continuing research on *Prosopis alba*, an Argentine mesquite tree, in cooperation with the Forestry Research Station at Catholic University of Santiago del Estero in

Argentina. *Prosopis alba*, which originated from the plantations of Catholic University of Santiago del Estero, is a highly salt-tolerant tree species that holds promise of ameliorating subsurface drainage problems in the soils of the western San Joaquin Valley. There were a number of trees that were planted at several drainage-impaired locations within the west side of the San Joaquin Valley. DWR has partnered with the Westside Resource Conservation District to monitor the growth and performance of the trees. A group of trees with the best salt and boron tolerance qualities were selected for final testing and were planted in a test site on the west side of the San Joaquin Valley for monitoring.

DWR continues to collect operational data from IFDM projects at RRR and AndrewsAg, Inc. for performance analysis. DWR staff also provided technical information and assistance on an agriforestry planting program on Kern County farms with salinity and shallow groundwater problems.

DWR and the Center for Irrigation Technology at California State University, Fresno, are working together with the New Jerusalem Drainage District in western San Joaquin County in a study to develop an operation and management plan to manage water supplies more efficiently and reduce subsurface drainage water. The main goal is for farmers to use their water supplies efficiently and minimize percolation losses into the local underground shallow water table. A primary goal of the New Jerusalem Drainage District is to eliminate the discharge of subsurface drainage water collected from the underground water table into the San Joaquin River. A secondary goal is to meet its respective objectives without adversely impacting soil and water quality and crop productivity within the district. The combined goals result in a complex mix of irrigation and drainage management activities that need to be integrated into a single plan.

Central Valley Salinity Management Program

In 2006, the Central Valley Regional Water Quality Control Board and SWRCB initiated a comprehensive effort to address salinity problems in California's Central Valley and adopt long-term solutions that would lead to enhanced water quality and economic sustainability. The Central Valley Salinity Alternatives for Long-term Sustainability is an effort to develop and implement a comprehensive salinity management program. DWR is involved in the process by providing expertise in salinity management through participation in the committees and activities of the Central Valley Salinity Policy Group. This group provides guidance and technical support on specific issues through various committees (the Technical Advisory Committee, Social and Economic Impact Committee, and Public Education and Outreach Committee) and overall direction and management (the Executive Committee) for the development of a comprehensive Central Valley salinity management plan.

Drainage Reduction and Reuse Program

DWR's Drainage Reduction and Reuse Program offers technical assistance, information, and other resources to growers and irrigators for applying irrigation water efficiently to reduce both excessive deep percolation and drainage water from the immediate on-farm source, while maintaining salt balance in the root zone.

The program objective is achieved through continued on-farm demonstration projects, studies, research, training, and workshops on scheduling irrigation management, advances in irrigation technologies, evaluating irrigation systems, reusing drainage water, and managing salinity.

Development of Alternative Value-Added Products from Cactus (*Opuntia*) Grown as a New Fruit/Forage Crop for Selenium-Laden Waters and Drainage-Impacted Soils in the West Side of Central California.

DWR is working with the U.S. Department of Agriculture and California State University, Fresno, in a research project to provide new and realistic information for growing and producing value-added products from *Opuntia* crops irrigated with poor-quality water and grown under nonirrigated conditions in the west side of Central California, as well as grown in poor-quality sediment soil. An additional research objective is to determine the potential of *Opuntia* for managing naturally occurring selenium, present in drainage waters and impaired soils in the west side of the San Joaquin Valley, via accumulation and volatilization, as well as for producing new marketable food products.

Environmental Services

DWR's South Central Region Office's Environmental Compliance Section investigates and reports on IFDM and other systems used for disposal and management of drainage water. Environmental activities include RRR research projects that involve biological monitoring activities required in accordance with Waste Discharge Requirements permits.

San Joaquin River Water Quality Improvement Program

DWR's Agricultural Drainage Program, in collaboration with other agencies, continues to make significant efforts to improve water quality in the San Joaquin River to benefit the State and SWP water contractors. These efforts are intended to control salinity and selenium discharges upstream of Vernalis. They include promoting on-farm and regional water management activities to reduce subsurface drainage, real-time water quality management to maximize the assimilative capacity of the San

Joaquin River, and efforts to time wetlands discharges when there is assimilative capacity in the San Joaquin River.

Specific efforts include the West Side Regional Plan, Reclamation's San Luis Drainage Feature Reevaluation to provide drainage service to the San Luis Unit of the Central Valley Project, and the IFDM program maintained by DWR and collaborating agencies.

On-farm and Regional Drainage Management Activities. Agricultural Drainage Program staff continued working with the Grassland Area Farmers to help reduce subsurface agricultural drainage water discharges into the San Joaquin River. Drainage management activities involving source control and drainage reuse have proven effective in reducing salt loads in the San Joaquin River. Since the Grassland Area Farmers implemented the Grassland Bypass Project, drainage discharges have decreased from 58,000 af to less than 14,000 af, and salt loads have been reduced from 210,000 tons to about 57,000 tons. The reductions were possible due to the San Joaquin River Improvement Project, an important Grassland Bypass Project component, funded by DWR through Propositions 13 and 50. It consists of 6,000 acres of land dedicated for reuse of subsurface drainage water generated by Grassland Area Farmers to grow salt-tolerant crops. DWR continued to provide technical assistance to improve and develop this part of the Grassland Bypass Project.

Real-time Water Quality Monitoring Program. The Real-time Water Quality Monitoring Program (RTWQMP) collects flow, electrical conductivity, and temperature data from several satellite-linked and web-accessible stations on the mainstem of the San Joaquin River and its tributaries. The information provided can be used by San Joaquin River water managers and stakeholders to improve management and coordination of

east side reservoir releases and agricultural and wetland drainage flows to achieve water quality objectives at the San Joaquin River compliance points. In the early stages, RTWQMP was funded by Reclamation and then by CALFED. Currently, DWR has assumed responsibility for funding most of the RTWQMP.

Forecasting flow and salinity conditions on the San Joaquin River allows decision makers to take advantage of assimilative capacity of the river when available. Data collected from the network of monitoring stations is used with the San Joaquin River Input-Output Day model to generate biweekly forecasts of salinity and flow conditions on the river near Vernalis and other upstream stations. DWR publishes the information weekly on its website.

Water Conservation Bond Laws

To help local agencies obtain financing for their water management programs, California voters approved eight bond laws between 1984 and 2006 authorizing DWR to provide low-interest loans and grants to fund project feasibility studies or construction activities.

- The Clean Water Bond Law of 1984 (Proposition 25) authorized \$10.5 million for water conservation projects.
- The Water Conservation and Water Quality Bond Law of 1986 (Proposition 44) authorized \$75 million for water conservation and groundwater recharge projects.
- The Water Conservation Bond Law of 1988 (Proposition 82) authorized \$60 million for water conservation, groundwater recharge, and new local water supply improvements.
- The Safe, Clean, Reliable Water Supply Act (Proposition 204), approved in 1996, authorized \$55 million for water

conservation, groundwater recharge, and local water supply projects.

- The Safe Drinking Water, Clean Water, Watershed Protection, and Flood Protection Bond Act (Proposition 13), approved in 2000, authorized \$535 million for agricultural and urban water conservation, groundwater recharge, infrastructure rehabilitation, groundwater storage, and interim reliable water supply projects and studies.
- The Water Security, Clean Drinking Water, Coastal and Beach Protection Act of 2002 (Proposition 50) authorized \$500 million for the Integrated Regional Water Management (IRWM) Grant Program to be implemented jointly by DWR and SWRCB.
- The Safe Drinking Water, Water Quality and Supply, Flood Control, River and Coastal Protection Bond Act of 2006 (Proposition 84) authorized \$1 billion to continue the IRWM Grant Program. Under this program, grants and construction loans are available with repayment periods of up to 20 years at reduced interest rates for most programs.
- The Disaster Preparedness and Flood Prevention Bond Act of 2006 (Proposition 1E) authorized \$300 million for IRWM Stormwater Flood Management.

Propositions 25, 44, and 204

Funding is fully obligated.

Proposition 82

New local water supply construction and feasibility study loans are still available. Water conservation and groundwater recharge funding has been fully obligated.

Proposition 13

Agricultural water conservation loan funding is still available.

All loan and grant funds for the Groundwater Recharge, Infrastructure Rehabilitation, Urban Water Conservation, Groundwater Storage, and Interim Reliable Water Supply programs have been obligated.

Integrated Regional Water Management Grant Program

The IRWM Grant Program is funded by Propositions 50, 84, and 1E.

Proposition 50

All Proposition 50 funds have been obligated.

Propositions 84 and 1E

In 2011, DWR conducted a second round of the IRWM Regional Acceptance Process (RAP). The RAP is the mechanism by which DWR evaluates newly forming and existing IRWM regions in order to allow them to compete for available IRWM grant funding. In September, the Director approved the final RAP decision, in which 10 IRWM regions were granted full acceptance into the grant program; including 7 regions that had previously been granted conditional acceptance in 2009, and 3 that were new regions. As of 2011, there were 48 IRWM regions in the State. These regions cover 87 percent of the land area and are inclusive of 99 percent of the population.

The IRWM Grant Program concluded three major grant solicitation efforts in 2011, awarding more than \$400 million in funding from Proposition 84 and Proposition 1E.

- In February, DWR awarded approximately \$21 million in Proposition 84 IRWM funding to 30 IRWM regions.
- In August, the Director approved final award of \$205 million in grant funding for 25 applications containing 190 projects for the Proposition 84 IRWM Implementation Grant Program.
- In December, DWR awarded \$178 million in Proposition 1E Stormwater Flood

Management grant funding to 18 entities to support the construction of 23 individual projects.

Local Water Supply. Projects in local water supply are constructed to increase water supplies, and include the following:

- new conveyance and/or storage facilities;
- groundwater extraction facilities and/or well-field development; and
- desalination (ocean or brackish groundwater recovery).

Chapter 6

Legislation and Litigation

The California Aqueduct.

Significant Events in 2011

Significant legislation related to the California Environmental Quality Act (CEQA) process; groundwater management; the Department of Water Resources (DWR) public contracting process; and eminent domain of property subject to a conservation easement passed in 2011.

Information for this chapter was provided by the Legislative Affairs Office and the Office of the Chief Counsel.

The Department of Water Resources (DWR) monitors State and federal legislation that affects management of the State Water Project (SWP). Legislative bill tracking involves reviewing legislation at its introduction, evaluating amendments in State Assembly and Senate committee hearings, and monitoring its enactment into law. The DWR Assistant Director for Legislation monitors proposed legislation. The Office of the Chief Counsel tracks State and federal litigation that impacts management of the SWP. The DWR Chief Counsel also manages legal cases that involve SWP operations.

Legislation

State Legislation

AB 209 (Ammiano; Chapter 171, Statutes of 2011)—California Environmental Quality Act, Lead Agency, Documents

Assembly Bill (AB) 209 requires a lead agency preparing an environmental impact report (EIR) or a negative declaration under the California Environmental Quality Act (CEQA) to ensure that access to the EIR or negative declaration is provided electronically.

AB 320 (Hill; Chapter 570, Statutes of 2011)—Environmental Quality: CEQA Determination, Dispute

CEQA provides a procedure by which a party may challenge the decision of a public agency and requires that party to notify real parties in interest of its challenge of the agency determination. AB 320 requires the public agency, in its notice, to list the recipient(s) of its approval for use by the petitioner in the service of its challenge.

AB 359 (Huffman; Chapter 572, Statutes of 2011)—Groundwater Management Plans

AB 359 requires local water agencies to map the recharge areas that substantially contribute to the replenishment of a groundwater basin and would condition the receipt of a State grant or loan upon

compliance with the law. AB 359 requires DWR to compile and post information on groundwater management plans on its website.

AB 1152 (Chesbro; Chapter 280, Statutes of 2011)—Groundwater

AB 1152 makes changes to SBX7 6 (Steinberg), of the 2009 Special Session on Water, concerning the responsibilities of agencies in reporting and monitoring groundwater basin elevations. It allows existing groundwater monitoring entities that do not meet the precise requirements for monitoring entities set forth in SBX7 6 to be grandfathered into the monitoring program for a 2-year period while they prepare groundwater management plans.

SB 224 (Pavley; Chapter 587, Statutes of 2011)—Public Contracts, DWR

Existing law provides that all contracts entered into by any State agency for goods, services, or other specified activities are void unless and until approved by the Department of General Services. That law provides exemptions for certain transactions and contracts. Senate Bill (SB) 224 also exempts all energy-related contracts from that law and allows DWR and the Department of General Services to develop a process whereby DWR has flexibility with regard to its selection of contractors under certain conditions.

SB 328 (Kehoe; Chapter 589, Statutes of 2011)—Eminent Domain Law, Conservation Easement

SB 328 revises eminent domain law to require public entities seeking to acquire property through eminent domain, where the property is subject to a conservation easement, to allow the holder of the conservation easement to participate in condemnation proceedings and seek compensation for its interest in the property.

Federal Legislation

There was no significant federal legislation in 2011 affecting management of the SWP.

Litigation

As of December 31, 2011, DWR was involved in, or closely monitored, a number of court cases and other actions related to the management of the SWP.

Sacramento-San Joaquin Delta

Delta Smelt

Delta Smelt Consolidated Cases (U.S. Dist. Ct., Eastern Dist. Cal., No. 1:09-cv-407).

San Luis & Delta-Mendota Water Authority, et al. v. Salazar, et al. (U.S. Dist. Ct., Eastern Dist. Cal., No. 1:09-cv-00407); *State Water Contractors v. Salazar, et al.* (U.S. Dist. Ct., Eastern Dist. Cal., No. 1:09-cv-00480); *Coalition for a Sustainable Delta, et al. v. United States Fish and Wildlife Service, et al.* (U.S. Dist. Ct., Eastern Dist. Cal., No. 1:09-cv-00422); *Metropolitan Water District of Southern California v. United States Fish and Wildlife Service, et al.* (U.S. Dist. Ct., Eastern Dist. Cal., No. 1:09-cv-00631); *Stewart and Jasper Orchards, et al. v. United States Fish and Wildlife Service, et al.* (U.S. Dist. Ct., Eastern Dist. Cal., No. 1:09-cv-00892); *Family Farm Alliance v. Kenneth Salazar, et al.* (U.S. Dist. Ct., Eastern Dist. Cal., No. 1:09-cv-01201).

Litigation stemming from a coalition of environmental groups' challenge to the

2004 biological opinion (BO) on delta smelt issued by the U.S. Fish and Wildlife Service continued. (Details of this litigation are described in earlier bulletins.)

In March 2011, the federal district court issued a final judgment after finding that the Bureau of Reclamation unlawfully failed to prepare an adequate National Environmental Policy Act (NEPA) analysis before adopting the 2008 BO, and that the BO was unlawful on several grounds. The court ordered the U.S. Fish and Wildlife Service to prepare a new BO and the Bureau of Reclamation to prepare an environmental impact statement (EIS) pursuant to NEPA. The parties have appealed.

Salmon

The Consolidated Salmon Cases (U.S. Dist. Ct., Eastern Dist. Cal., No. 1:09-cv-1053).

San Luis & Delta-Mendota Water Authority, et al. v. Gary F. Lock, as Secretary of the United States Department of Commerce, et al. (U.S. Dist. Ct., Eastern Dist. Cal., No. 1:09-cv-1053); *Stockton East Water District, et al. v. National Oceanic and Atmospheric Administration, et al.* (U.S. Dist. Ct., Eastern Dist. Cal., No. 1:09-cv-1090); *State Water Contractors v. Gary F. Locke, Secretary, etc., et al.* (U.S. Dist. Ct., Eastern Dist. Cal., No. 1:09-cv-1053); *Kern County Water Agency, et al. v. United States Department of Commerce, et al.* (U.S. Dist. Ct., Eastern Dist. Cal., No. 1:09-cv-1520); *Oakdale Irrigation District, et al. v. United States Department of Commerce, et al.* (U.S. Dist. Ct., Eastern Dist. Cal., No. 1:09-cv-1580); *The Metropolitan Water District of Southern California v. National Marine Fisheries Service, et al.* (U.S. Dist. Ct., Eastern Dist. Cal., No. 1:09-cv-1625).

Litigation initiated in 2004 challenging the National Marine Fisheries Service's nonjeopardy BO for salmon on the proposed Central Valley Project (CVP)/SWP operations resulted in a new BO which concluded that CVP/SWP operations would likely cause jeopardy to the salmonid species,

sturgeon, and orcas, and would adversely modify designated critical habitat for three salmon species. In response, federal and State water contractors challenged the new BO on the grounds that federal defendants failed to comply with NEPA, the Endangered Species Act, and the reasonable and prudent alternative. DWR joined the litigation as an intervenor in January 2010.

In September 2011, the court ruled the salmon BO was inadequate and ordered that a new BO be prepared by the National Marine Fisheries Service. The parties have appealed.

California Water Impact Network, California Sportfishing Protection Alliance, and AquAlliance v. California State Water Resources Control Board and California Department of Water Resources (Super. Ct. Sacramento County, No. 34-2010-80000653). The conservation groups allege that permit approvals and enforcement failure by the State Water Resources Control Board (SWRCB) has allowed DWR to cause extensive damage to the Bay-Delta Estuary and the fish and wildlife that live there. The administrative record is being prepared.

Longfin Smelt

State Water Contractors v. California Department of Fish and Game, Donald Koch, Director of the California Department of Fish and Game, California Department of Water Resources, Lester Snow, Director of the California Department of Water Resources (Super. Ct. Sacramento County, No. 34-2009-80000203). This case, which challenges Incidental Take Permit No. 2081-2009-001-03 issued by the Department of Fish and Wildlife, remains stayed pending completion of the federal litigation challenging the BOs for delta smelt and salmon. The permit authorized the SWP to take longfin smelt, which inhabit the Sacramento-San Joaquin Delta and the San Francisco and San Pablo bay areas, under limited conditions that have the potential of substantially reducing the

ability of the SWP to regulate the ongoing and long-term provision of water deliveries.

In 2011, the parties commenced settlement discussions.

Bay Delta Conservation Plan

Central Delta Water Agency, South Delta Water Agency, RC Farms, Inc. and Reclamation District 999 v. California Department of Water Resources (Super. Ct. Sacramento County, No. 2010-80000698). In October 2010, parties with Delta interests filed a lawsuit challenging DWR's approval of the engineering geotechnical studies for the Delta Habitat Conservation and Conveyance Program. The studies are intended to assist DWR in identifying the best options for the construction of an isolated conveyance facility.

At an August 5, 2011, hearing, the court heard testimony as to whether there was substantial evidence to suggest a potential impact in the area of aquatic noise. A decision is expected from the court early in 2012.

In Re: Department of Water Resources Cases (Super. Ct. San Joaquin County, No. JCCP4594) (Court-Ordered Entry cases).

Twenty-four Delta property owners declined to grant DWR's request to gain temporary entry onto their properties in order to perform environmental and geological surveys. DWR sought orders for temporary entry onto the respondents' properties under Code of Civil Procedure Section 1245.010 et seq.

The court granted DWR's request for environmental surveys. However, in April 2011, the court denied DWR's request for geotechnical surveys on the grounds that the proposed surveys were a taking and beyond the scope of studies allowed under Code of Civil Procedure Section 1245.010 et seq. The parties appealed (see case below).

Property Reserve, Inc. v. The Superior Court of San Joaquin County (C067758, writ denied). The Delta landowners appealed the environmental order and DWR filed an appeal from the order denying the geotechnical surveys. After the Third District Court of Appeal denied the landowners' appeal, the landowners took their petitions to the Supreme Court. The Supreme Court granted the petitions and directed the Third District Court of Appeal to reconsider the matter. The Third District Court of Appeal then granted the landowners' request for stay and consolidated the appeals. All briefs in these matters have been filed, and the parties are waiting for the appellate court to set a hearing date.

State Water Resources Control Board Hearing

SWRCB Water Right Decision 1641 contains a water quality objective requiring DWR to annually maintain 0.7 millimhos per centimeter electrical conductivity at three compliance points within the South Delta, from April 1 through August 31, beginning in 2005. In response to allegations that the water quality objective was not being met and would not be met, the SWRCB issued a cease and desist order, which was final on May 16, 2006, requiring DWR and the Bureau of Reclamation to take corrective actions to eliminate the threat of noncompliance.

After a period of negotiations, the SWRCB issued a final order on January 5, 2010, modifying its 2006 order, which extended the schedule to implement measures to meet the water quality objectives pending completion of the SWRCB's review and potential modification of the salinity objectives. The order also required DWR, along with the Bureau of Reclamation, to undertake studies to assess the feasibility of implementing various measures to meet the salinity objectives. In 2011, DWR continued to abide by the cease and desist order and work with the SWRCB and the Delta Watermaster

to facilitate lasting solutions to the issues faced by DWR.

Jones Tract

Armando P. Vanni, et al. v. Rindge Land Reclamation District #2039 (Super. Ct. San Joaquin County, No. CV025820)

Three consolidated lawsuits alleging damages arising out of the levee breach on Upper Jones Tract in 2004 went to trial from August 22 to December 29, 2011. A decision is expected within 90 days.

Hydropower

Hyatt-Thermalito

Alameda County Flood Control & Water Conservation District, Zone 7 et al. v. State of California Department of Water Resources (C065522). Judgment was entered and an appeal was filed by 14 of the 29 State Water Contractors in the 2005 lawsuit alleging that the method used by DWR to allocate costs and revenue of its Hyatt and Thermalito power plants at Lake Oroville violated the terms of long-term water supply contracts.

Briefing has been completed and oral argument will likely take place in late 2012.

Oroville Relicensing—Federal Energy Regulatory Commission Project No. 2100

Butte County v. Department of Water Resources (Super. Ct. Yolo County, No. C071785). DWR is seeking renewal of the Federal Energy Regulatory Commission (FERC) license for its hydroelectric generation facilities at Oroville (Project No. 2100). DWR filed its relicensing application in 2005. The original 50-year FERC license expired on January 31, 2007. In February 2008, FERC authorized continued operation by issuing an annual license—under the same terms and conditions—that renews each year until FERC issues a new 50-year license.

DWR used a collaborative approach (the Alternative Licensing Process) to reach agreement with federal and State resource agencies, Native American tribes, local public agencies, nongovernmental organizations, and others on operational and design changes and environmental issues.

In March 2006, DWR filed a final settlement agreement with FERC executed by more than 50 interested parties. FERC's final EIS on the project was issued in May 2007. The SWRCB issued its water quality certification in December 2010.

DWR certified the EIR under CEQA and filed a notice of determination in July 2008. Butte and Plumas counties brought mandate proceedings in Butte County Superior Court challenging the adequacy of the EIR and seeking to vacate DWR's approval of the project. The petitions were consolidated and transferred to Yolo County. DWR lodged its CEQA administrative record on the project with the court in September 2009. In November 2010, the court heard oral argument on DWR's motion to compel payment of its record preparation costs. Trial in the case is set for January 17, 2012.

Other Cases

The Monterey Amendment

***Central Delta Water Agency et al. v. California Department of Water Resources* (Super. Ct. Sacramento County, No. 34-2010-80000561) (Central Delta I); *Central Delta Water Agency et al. v. Kern County Water Agency et al.*, DWR et al., real parties in interest (Super. Ct. Kern County, No. S-1500-CV-270965) (Central Delta II); *Rosedale-Rio Bravo Water Storage District and Buena Vista Water Storage District v. DWR* (Super. Ct. Kern County, No. S-1500-CV-270635-KCT) (Rosedale-Rio Bravo).** Legal challenges were brought against the 1995 Monterey Amendment and the EIR adopted by DWR in 2010. (The Monterey Amendment, litigation challenging the amendment and

the first EIR, and the settlement of that litigation and development of the second EIR are described in earlier bulletins.)

Central Delta I challenges the EIR adopted by DWR in 2010. Petitioners allege that the EIR fails to comply with CEQA. It is also a reverse validation petition, seeking a declaration that the Monterey Amendment and the transfer of the DWR-owned Kern Water Bank to Kern County Water Agency are invalid.

Central Delta II is also a reverse validation petition, seeking a declaration that the transfer of the Kern Water Bank from the Kern County Water Agency to the Kern Water Bank Authority is invalid.

Rosedale-Rio Bravo, filed by local public entities in Kern County that are adjacent to the Kern Water Bank, challenges the EIR on its description of the past, present, and future use and operation of the Kern Water Bank lands and their impacts.

Central Delta II was stayed pending resolution of the *Central Delta I* case. *Central Delta I* and *Rosedale-Rio Bravo* were coordinated for trial purposes. The parties are still preparing a record that can be certified for the CEQA litigation.

Water Diversions

***Cortopassi Partners, a California limited partnership and Reclamation District 2086 v. The State of California* (Super. Ct. San Joaquin County, No. CV034843).** Plaintiffs allege that DWR has created and maintained a nuisance in the Sacramento-San Joaquin Delta by artificially diverting water through the Delta for the SWP.

The settlement conference for this case is set for January 30, 2012, and the trial is set for February 27, 2012.

Drought Water Bank

Butte Environmental Council, California Sportfishing Protection Alliance and California Water Impact Network v. Department of Water Resources, California Natural Resources Agency, Governor Arnold Schwarzenegger and Does 1-50 (Super. Ct. Alameda County, No. 09446708). On February 27, 2009, the Governor proclaimed a statewide drought emergency. In March 2009, DWR implemented the 2009 Drought Water Bank to transfer water to areas in need, after filing a notice of exemption from CEQA with the concurrence of the California Natural Resources Agency and the California Environmental Protection Agency.

In April 2009, Butte Environmental Council and others brought a mandate proceeding against DWR and the other two agencies challenging DWR's reliance on the Governor's proclamation in claiming the CEQA emergency exemption.

In 2011, all parties entered into a settlement agreement. DWR will recover the money paid under the agreement from the water contractors who received water through the Drought Water Bank. The appeal has been dismissed.

Breach of Contract Arbitration

State of California acting by and through the Department of Water Resources v. Whitaker Contractors, Inc., a California corporation; Whitaker Contractors, Inc., a California corporation v. State of California acting by and through the Department of Water Resources (OAH No. A-0031-07). This breach of contract claim arose out of the Tehachapi East Afterbay completion construction project. The contractor failed to perform work according to contract requirements and was terminated. After lengthy arbitration proceedings, on August 11, 2011, the superior court entered a final judgment upholding the termination of the contractor and awarding DWR \$16.4 million. Whitaker has appealed the court's judgment, and

the parties will be filing appellate briefs in 2012. In the meantime, DWR is commencing efforts to collect on the judgment.

Colorado River

Quantification Settlement Agreement Cases ((2011) Cal.App.4th 758). These nine claims, which have been coordinated into a single proceeding before the Sacramento County Superior Court, challenge the Quantification Settlement Agreement (QSA) and associated actions taken to implement the QSA—a collection of 38 agreements that resolve disputes among water users in Southern California regarding their rights to California's shrinking share of Colorado River water. (The QSA and earlier litigation activities are described in bulletins from 2007 through 2010.)

On December 7, 2011, the Third District Court of Appeal reversed the trial court judgment. The court held that the State's financial obligation to fund all mitigation costs did not violate California Constitution Article 16, Sections 1 or 7—the legislative appropriation and debt limitation provisions. Respondents have sought Supreme Court review.

Area of Origin

Solano County Water Agency, Napa County Flood Control and Water Conservation District, City of Yuba City, and County of Butte v. California Department of Water Resources and Does 1-50 (Super. Ct. Sacramento County, No. 34-2008-00016338). In July 2008, four SWP water supply contractors—Solano County Water Agency, Napa County Flood Control and Water Conservation District, City of Yuba City, and County of Butte—sued DWR claiming priority to delivery of SWP water and protections from water shortages based on area and watershed of origin statutes, and because they signed SWP water supply contracts. Fourteen SWP contractors located south of the Delta and outside the area of origin have intervened.

The case has been stayed pending informal mediation by the parties to settle the matter.

Perris Dam

Metropolitan Water District; Coachella Valley Water District; Desert Water Agency, Real Parties; Albert Thomas Paulek v. California Department of Water Resources (Super. Ct. Riverside County, No. RIC1120142).

On December 21, 2011, Paulek filed a writ petition challenging DWR's approval of the Perris Dam remediation program final EIR. The petition raises numerous challenges, including that the EIR does not adequately address and mitigate for impacts to the endangered Stephen's Kangaroo Rat or to impact to various species covered by a multispecies habitat conservation plan. DWR is not willing to prepare the administrative record until the petitioners agree to pay the estimated costs for doing so. The parties have not yet resolved what should go in the record or what constitutes appropriate costs.

Silverwood Lake

Valerie Hamm and Thomas Hamm v. County of San Bernardino, San Bernardino County Flood Control District, Victor Valley Wastewater Reclamation Authority, Mojave Water Agency, State of California (Super. Ct. San Bernardino County (Victorville District), No. 1105980).

Plaintiffs in this case own property along and in the bed of the Mojave River, in Oro Grande. They are suing for damage to their property caused by diverted waters of the vegetation-choked portions of the Mojave River during storms in December 2010. DWR does not believe the plaintiff's theory of causation states a cause of action against DWR and is seeking to have the complaint against DWR dismissed.

Environmental Review Acts

The National Environmental Policy Act (NEPA) (Title 42 United States Code Sections 4321–4347 [1970]) and the California Environmental Quality Act (CEQA) (California Public Resources Code Sections 21000–21177 [1970]) require government agencies to document and consider environmental consequences of their actions in their decision-making processes. NEPA states that it is the goal of the federal government to use all practicable means consistent with other considerations of national policy to protect and enhance the quality of the environment. All federal agencies must prepare an environmental impact statement (EIS), including a discussion of mitigation measures and alternatives, for federal actions that could significantly affect environmental quality.

CEQA is patterned after NEPA. Under CEQA, agencies are required to (1) disclose, through an environmental impact report (EIR), the significant impacts a proposed project would have on the environment, and (2) identify ways to reduce or avoid environmental damage.

CEQA applies to projects directly undertaken, funded, or approved by State or local agencies. NEPA applies to projects directly undertaken, funded, or approved by federal agencies. The Department of Water Resources (DWR) conducts many projects in cooperation with federal agencies. In these cases, both CEQA and NEPA must be followed.

NEPA requires that mitigation measures and alternatives be disclosed to the public in the EIS, but it does not generally require federal agencies to adopt such mitigation measures or alternatives. CEQA does impose substantive duties on all California government agencies approving projects with significant environmental impacts to adopt alternatives or mitigation measures that they find to be feasible to substantially lessen these impacts, unless there are overriding reasons they cannot. When a project is subject to both CEQA and NEPA, both laws encourage agencies to cooperate in planning the project and preparing joint environmental documents.

The environmental review process allows citizens to learn about a proposed project and its potential significant effects and to participate in the decision-making process by providing feedback on agency information. The review process requires agencies to:

- describe the proposed project and the purpose or need for it;
- identify the lead and cooperating agencies involved in the project;
- invite interested parties to participate in the process;
- determine the scope of study with input from responsible agencies and the public;
- prepare and distribute a draft EIS or EIR;
- respond to comments received on the draft;
- prepare the final EIS or EIR;
- make findings and adopt feasible alternatives or mitigation measures to avoid significant effects, if applicable;

Environmental Review Acts

- adopt a monitoring plan to ensure compliance with mitigation measures; and
- prepare a list of permits required to implement the project if it is approved.

The scoping phase, which occurs early in the review process, is particularly important because it enables government agencies to identify issues and topics to be considered or addressed in the EIS or EIR.

Information gathered in the scoping phase helps agencies identify and evaluate reasonable alternatives, identify potential environmental impacts of the project, determine data and information needed, develop a work schedule, and allocate resources for preparing and distributing the draft environmental document for public review and comment.

NEPA requires a lead agency to involve the public during scoping, while CEQA does not. CEQA, however, does encourage public involvement, and agencies often opt to conduct activities that provide for wide public involvement. Members of the public may raise issues and identify additional alternatives, environmental effects, methods of assessment, and mitigation measures during the scoping phase and continue to participate in the review process for the draft environmental document. Thus, the CEQA process may lead to changes in a project through the development, consideration, and adoption of alternatives or enforceable mitigation measures to avoid or reduce any potential significant adverse effects on the environment.

If the project is approved, the lead agency publishes a document discussing all the factors considered in reaching its decision to proceed with the proposed action. It also discusses whether all practical means to avoid or minimize environmental harm have been adopted, and if not, the reasons they were not.

Chapter 7

Water Supply Development and Reliability

Farming in the Sacramento-San Joaquin Delta.

Significant Events in 2011

Calendar year 2011 was a wet year, and the final State Water Project (SWP) allocation was set at 80 percent on April 20. The year was sufficiently wet that the Sacramento-San Joaquin Delta remained in excess conditions until late in the year, precluding any water transfers during the year.

This wet hydrology prevented accounting of Yuba County Water Agency releases as transfer water under the Lower Yuba River Accord (Yuba Accord) for the entire summer transfer season.

Information in this chapter was contributed by the State Water Project Analysis Office, the Division of Integrated Regional Water Management, the Division of Statewide Integrated Water Management, and the Bay-Delta Office.

The Department of Water Resources (DWR) is working to improve the reliability of State Water Project (SWP) supplies and the long-term water contract annual Table A water allocations delivered to SWP water contractors. Staff is engaged in planning activities to develop additional water supplies and storage capacity.

Developing new water supplies and storage projects that are economically, environmentally, and technically sound, while satisfying institutional requirements and political concerns, presents significant challenges. Many concerns center on possible adverse effects that additional storage and delivery facilities may have locally and on the Sacramento-San Joaquin Delta. In the SWP conveyance system, the Delta is the critical link between water supplies in the Sacramento Valley and deliveries to the rest of the Central Valley and Southern California.

DWR works with the State and federal governments, local agencies, and public interest stakeholder groups to ensure water supply reliability now and in the future. To meet SWP water contractors' needs for sufficient water supplies, DWR is engaged in planning, developing, and providing local assistance with the objective of augmenting future SWP water supplies.

Supply Development and Reliability

Some of the activities DWR is engaged in to augment future SWP supplies include:

- facilitating transfers between SWP long-term contractors and other agencies, including Central Valley Project (CVP) contractors;
- funding studies on the evapotranspiration of rice and the Giant Garter Snake, a protected species known to inhabit rice growing regions of the Sacramento

Valley, to better understand issues related to the transfer of water made available by crop idling;

- assisting with developing and implementing local and regional conjunctive use programs in the Sacramento Valley;
- constructing a groundwater monitoring network and a subsidence monitoring network to detect potential impacts caused by pumping associated with groundwater substitution transfers;
- managing the Feather River watershed above Lake Oroville to reduce sedimentation in the lake and preserve storage capacity; and
- investigating and evaluating storage projects.

Water Conveyance Through the SWP

DWR encourages and facilitates temporary transfers of water using SWP conveyance facilities for long-term SWP water contractors and other agencies to help meet local, State, and environmental water supply needs. As a practical matter, SWP facilities are often needed to convey transfer water from the existing place of use to the place of use of the transferee. State law requires DWR to make unused SWP capacity available for transfers upon payment of fair compensation, provided that (1) no legal user of water will be injured; (2) there will be no unreasonable effect on fish, wildlife, or other instream beneficial uses; and (3) there will be no unreasonable effect on the overall economy or the environment of the county

from which the water is being transferred (California Water Code [CWC] Section 1810). Water transfers can involve transfers and exchanges among SWP long-term water contractors, between SWP water contractors and non-SWP entities, or between two or more non-SWP entities.

Due to the wet hydrologic conditions, DWR did not convey transfer water in 2011.

Transfer and Exchange Evaluations

An important element of any water transfer is determining what quantity of water, if any, is transferable.

The transferability of water depends on many factors including the source of the water being transferred, what is being done to make water available, when the water can be made available, and the type of water right the existing user holds. Several CWC provisions authorize temporary transfers of water rights issued by the State Water Resources Control Board (SWRCB) (appropriative water rights issued after 1914) and put conditions on the transfers to protect those not involved in them.

Short-term transfers, of less than one year, are authorized under Sections 1725–1732. Long-term transfers, for periods greater than one year, are authorized by Sections 1735–1737. Other CWC sections specify conditions under which water can be transferred and legal protections for those transferring water.

Transfers based on water rights obtained before 1914 are not under the jurisdiction of the SWRCB but must comply with the requirements of the California Environmental Quality Act (CEQA) and possibly the National Environmental Policy Act (NEPA).

The CWC sections noted above contain provisions intended to protect other legal users of water and fish and wildlife from the possible adverse effects of a water transfer.

These provisions reflect the concept that changes can be made to the authorized place and purpose of use or point of diversion of a water supply as long as there is no injury to others as a result of the change (the “no injury rule”). The no injury rule in State water law is intended to protect other water right holders from the potential expansion of water use beyond what would have been used by the water rights holder in the absence of the transfer. Hence, under the no injury rule, only “new water” is transferable (i.e., water added to the downstream water supply only as a result of the transfer). To protect other users, a transfer would not be authorized to the extent that it would reduce the amount or timing of water that would have been available to downstream users, regardless of the water right priority of those users.

CWC Section 1810(d) requires DWR to consider potential impacts of a transfer on legal users, instream uses, and the economy of the area from which the water would be transferred. DWR must determine whether to allow use of any surplus water conveyance capacity for a transfer. DWR reviews each request to transfer water through SWP facilities to assure that only new water will be transferred. This requirement applies to transfers based on both pre-1914 and post-1914 water rights.

Transfer water is typically developed through four methods: surplus water released from storage facilities, substitution of groundwater for transferred surface water, idling agricultural land or shifting to lower water use crops, and undertaking conservation activities that develop new water. Transfers may result in direct impacts and third-party impacts (impact to parties not involved in the transfer). Certain CWC provisions were enacted to limit potential impacts. For example, additional groundwater pumping from a groundwater substitution program can potentially affect other groundwater

users in the area. CWC Section 1745.10 generally requires that transfers of surface water in which groundwater will be pumped to make up for the transferred surface water: (1) be consistent with a groundwater management plan adopted pursuant to State law for the affected area, or (2) not create or contribute to conditions of long-term overdraft in the affected groundwater basin.

Injury can also occur due to stream depletion induced by increased pumping from wells for groundwater-based transfers. The amount of water depleted from the stream must be deducted from the total groundwater pumped for the transfer or the net surface water flows will not increase as assumed. Consequently, to evaluate possible impacts from groundwater substitution transfers, DWR assesses a streamflow depletion factor, which represents an estimate of the effects of the additional groundwater pumping on the surface water system. Each type of transfer has its own set of potential impacts that must be evaluated to protect parties not involved in the transfer.

With the exception of short-term transfers under CWC Section 1725, which provides for an expedited process for water rights issued by the SWRCB, water transfers are subject to compliance with CEQA and, possibly, NEPA. The CEQA/NEPA and SWRCB processes provide opportunities for public review and comment on water transfer proposals.

Staff in the State Water Project Analysis Office, Division of Operations and Maintenance, Division of Integrated Regional Water Management, and the Office of the Chief Counsel evaluate proposed water transfers to determine whether the transfers will impact the SWP, other water users, the environment, or the area from which the water will be transferred.

SWP Delivery Reliability Report

To assist local agencies assessing their overall water supplies, DWR provided current data on the SWP's ability to deliver water under 2009 conditions and for projected conditions in a biennial report entitled the *Draft State Water Project Delivery Reliability Report 2009*. The 2009 report was finalized in August 2010, and the next draft update of this report, originally expected in 2011, is now expected early in 2012.

Delivery reliability depends on three factors: (1) the availability of water at the source, (2) the ability to convey water from the source to the desired point of delivery, and (3) the level of demand. Information in the 2009 report for projected conditions accounts for the forecast effects of climate change. In addition, the analysis of the ability to convey water from the source to the point of delivery assumes only SWP facilities and permits existing in 2009. In order to provide a conservative estimate of water delivery reliability, no planned facility improvements to the SWP are assumed. Lastly, the level of demand for SWP water, the amount, and the pattern of demand, were derived from historical data and information received from SWP water contractors.

Figure 7-1 shows the probability that a given amount of SWP annual Table A water will be delivered from the Delta for conditions in 2009 and projected to exist in 2029. The following can be deduced for year 2029 conditions:

- In 75 percent of the years, annual SWP Table A water delivery is estimated to be at or above 2.14 million acre-feet (maf) per year (52 percent of 4.13 maf).
- In 50 percent of the years, delivery is estimated to be at or above 2.60 maf per year (63 percent of 4.13 maf).
- In 25 percent of the years, delivery is estimated to be at or above 2.92 maf per year (71 percent of 4.13 maf).

Figure 7-1 SWP Annual Table A Water Delivery Probability for Years 2009 and 2029

Detailed information on the assumptions, data, and results of additional studies, as well as the other scenarios for annual Table A amounts, can be found in the reliability report referenced above, available on DWR’s website.

SWP Future Water Supply Program

The Future Water Supply Program coordinates DWR’s efforts to implement the Sacramento Valley Water Management Program, provides technical support within DWR for the Lower Yuba River Accord (Yuba Accord), and monitors and assesses conditions of the Sacramento Valley groundwater basin that affect

the yield of the SWP. The Future Water Supply Program’s goal is to determine the effects of Sacramento Valley groundwater management activities, including water transfers, on SWP water supply reliability, and recommend actions to improve or maintain that reliability.

The Future Water Supply Program’s Upper Feather River watershed management component evaluates the state of the Feather River watershed above Lake Oroville with respect to water management and restoration actions being planned or implemented within the watershed. These actions are intended to improve the ecological and hydrologic function of watersheds, thus affecting base flow,

improving flood attenuation, and reducing erosion and sedimentation.

In 2011, DWR continued a collaborative effort with local stakeholders to develop and enhance monitoring activities for assessing the immediate and long-term effects of these water management and restoration actions, especially those related to the plug and pond meadow restoration technique. Implementation of the Thompson Creek Meadow Water Budget Study continued in cooperation with the U.S. Forest Service. The study uses detailed monitoring to assess the pre- and post-project hydrologic effects of this plug and pond technique.

Sacramento Valley Water Management Program

The precursor to the current Future Water Supply Program was DWR's work to incorporate conjunctive-use projects in the Sacramento Valley into the SWP to increase SWP dry-year yield. Similar projects were proposed to be implemented by the Sacramento Valley Water Management Agreement, which was signed by stakeholders in early 2003.

For more information on issues surrounding the Sacramento Valley Water Management Agreement, see Bulletins 132-02, 132-03, and 132-04, available on DWR's website.

SWP Water Rights Activities

Water Right Permits

SWP operations are governed by the terms and conditions contained in DWR's water right permits and licenses along with other State and federal regulatory restrictions, including biological opinions (BOs) for the protection of endangered species. DWR holds water right permits authorizing SWP operations at each of the SWP facilities, including the Oroville and Delta facilities (which include the North Bay Aqueduct), for water supply purposes. Each permit

specifies the authorized quantities of direct diversion and diversion to storage, place of use, purpose of use, and time within which the permitted quantities must be put to beneficial use. A change in any of the terms and conditions contained in the water right permits and licenses, including a change in the place or purpose of use or point of diversion, requires SWRCB approval.

Diversion and use of SWP water throughout the SWP service area has increased since initial operations in the 1960s. However, due to a number of factors, including operational and regulatory constraints, the beneficial use of water has not yet reached the maximum quantities anticipated for full development of the SWP.

DWR filed a petition for change on February 10, 2010, to allow the transfer of up to 8,000 acre-feet (af) of SWP water from the Tulare Lake Basin Water Storage District service area and up to 2,000 af of SWP water from the Empire-West Side Irrigation District service area to land within Westlands Water District each year for a period of up to 15 years. Two landowners with acreage in the Tulare Lake Basin Water Storage District, Empire-West Side Irrigation District, and Westlands Water District requested the change to allow the delivery of a portion of their SWP water supply to land in the Westlands Water District. The SWRCB issued Order WR 2011-0010-DWR approving the change on April 1, 2011. No water was transferred in 2011 under the long-term petition.

Water Quality Control Plan for the San Francisco Bay/Sacramento-San Joaquin Delta Estuary

The Delta and Suisun Marsh are located where California's two major river systems, the Sacramento and the San Joaquin, converge and flow westward to meet incoming seawater tides flowing through the San Francisco Bay. The watershed of

the San Francisco Bay/Sacramento-San Joaquin Delta Estuary (Bay-Delta Estuary) is a critical source of water supply for much of California. The watershed is a source of drinking water for two-thirds of the State's population; it supplies some of the State's most productive agricultural areas; and it provides water for fish, wildlife, and other public trust uses of water within and upstream of the estuary.

Water originating in the Bay-Delta watershed is delivered to areas within the watershed and to areas south and west of the estuary. The largest water distribution systems that release stored water into the Delta and directly divert water from the Delta are the SWP, operated by DWR, and the federal CVP, operated by the Bureau of Reclamation (Reclamation). Numerous other water storage and diversion projects influence Bay-Delta Estuary inflows, outflows, water quality, and other hydrologic characteristics.

The SWRCB regulates both the quality of water in the Bay-Delta Estuary and the diversion and use of water released into and diverted from the estuary for water supply. The SWRCB coordinates its regulatory authorities under State laws governing water quality and water rights, ensuring that water quality is protected for all beneficial uses when water is diverted from the estuary.

Under its authority to protect beneficial uses of water, the SWRCB adopted the *Water Quality Control Plan for the San Francisco Bay/Sacramento-San Joaquin Delta Estuary* (WQCP) on December 13, 2006 (Resolution No. 2006-0098). The WQCP contains objectives for flow, salinity, dissolved oxygen levels, and other parameters necessary for protection of various beneficial uses such as municipal and industrial, agricultural, and fish and wildlife. The SWRCB implements these objectives in part or in whole, depending on the circumstances, through conditions on water right permits and licenses.

In 1999, the SWRCB adopted Water Right Decision 1641 (later modified by Order WR 2000-02) modifying the terms and conditions of a number of water right permits and licenses, primarily those for the SWP and CVP, to implement the objectives of the 1995 WQCP.

SWRCB Bay-Delta Proceedings—2011 Activities

In 2011, SWRCB proceedings examined a number of issues in the Bay-Delta Estuary relating to water quality, protection of beneficial use for agriculture and fish and wildlife, and salinity issues, among others, which have the potential to affect Delta water supply and reliability.

Strategic Workplan for the Bay-Delta Estuary

On July 16, 2008, the SWRCB adopted the *Strategic Workplan for Activities in the San Francisco Bay/Sacramento-San Joaquin Delta Estuary*. Although the workplan contains many water quality related elements, some elements are related to water supply reliability:

- reviewing southern Delta salinity and San Joaquin River flow objectives to protect water supply for agricultural beneficial use;
- comprehensively reviewing the 2006 WQCP and its implementation through water rights and other requirements to protect fish and wildlife beneficial uses and the public trust;
- evaluating SWP and CVP methods of diversion in the Delta to ensure that they are reasonable, beneficial, and protect the public trust;
- implementing actions under the SWRCB's statutory responsibilities regarding water right compliance, enforcement, and other activities to ensure adequate flows to meet water quality objectives; and

- implementing actions to promote water use efficiency for urban and agricultural water users.

General timelines in the workplan may change as a result of changes to the Bay Delta Conservation Plan timeline or other issues. SWRCB staff prepare quarterly updates on the implementation of the workplan and, as appropriate, recommend modifying activities in the workplan to ensure that SWRCB actions continue to protect beneficial uses in the Bay-Delta. In May 2011, SWRCB staff issued an update to the strategic workplan's element actions and timelines.

2006 Bay-Delta Plan Review

Water Code Section 13240 requires that the WQCP be periodically reviewed. Federal Clean Water Act Section 303(c) (33 U.S.C. Section 1313(c)) requires a triennial review of State water quality "standards," as defined in the act. A workshop on October 8, 2008, formally began a review of the 2006 WQCP.

The review and amendment process for the 2006 WQCP consisted of:

- identifying elements that may need amendment or new elements that may need to be added;
- preparing any amendments or revisions to the entire WQCP; and
- SWRCB's adoption of some or all of the amendments or revisions.

SWRCB information-gathering activities may affect the scope of the WQCP review and may include evidentiary hearings on critical issues concerning the Delta's ecology. The Bay Delta Conservation Plan environmental review may provide some of the analyses needed for the comprehensive WQCP review.

SWRCB's ongoing review and update of the 2006 Bay-Delta Plan continued in 2011.

Southern Delta Salinity and San Joaquin River Flow Objectives.

A January 2011 workshop was held for the SWRCB to receive comments and technical information and to discuss the *Draft Technical Report on the Scientific Basis for Alternative San Joaquin River Flow and Southern Delta Salinity Objectives* (October 2010). Following the workshop, the SWRCB initiated an external scientific peer review of the scientific basis and modeling contained in the report. The peer review was completed in November 2011.

In June, the SWRCB held a workshop to consider the scope and content of its environmental document relating to the review and the program of implementation of southern Delta salinity and San Joaquin River flow objectives.

For more information about salinity objectives and compliance monitoring in the South Delta, see Chapter 4, Water Quality Programs.

Storage Program

DWR is the State lead agency for the Storage Program, which consists of surface storage studies and groundwater programs and projects. The Storage Program began under the CALFED Bay-Delta Program. (For background on the CALFED Bay-Delta Program, see Bulletins 132-95 through 132-11 and/or Chapter 2, Delta Resources.)

The Storage Program is a comprehensive program with potential benefit for the SWP consisting of actions related to surface and groundwater storage. DWR's Division of Statewide Integrated Water Management and Division of Integrated Regional Water Management have been working with State and federal agencies to enhance storage and conjunctive-use programs that support local project development via loans and grants. The Storage Program is part of an ongoing evaluation of how storage, both

groundwater conjunctive use and surface storage, can help meet California's urban, agricultural, and environmental water supply reliability, ecosystem restoration, and water quality needs.

Surface Storage Investigations

Surface storage investigations are developing environmental documentation and feasibility studies for four of the five surface storage projects identified for further study in the CALFED record of decision.

In-Delta Storage Program

The In-Delta Storage Program may provide capacity to store approximately 217,000 af of water in the South Delta for a wide array of water supply, water quality, and ecosystem benefits. The project would include two storage islands (Webb Tract and Bacon Island) and two habitat islands (Holland Tract and Bouldin Island).

In 2007, further study of the In-Delta Storage Program was suspended, and no further work has been done on the project since then.

Los Vaqueros Reservoir Expansion Project

Contra Costa Water District (Contra Costa) owns and operates the 100,000 af Los Vaqueros Reservoir just southwest of the Sacramento-San Joaquin Delta. The Los Vaqueros Reservoir Expansion Project involves analysis of increasing reservoir storage by as much as 175,000 af, for a potential storage capacity of up to 275,000 af.

The project objectives are: (1) to develop water supplies for environmental water management; (2) to increase water supply reliability within the San Francisco Bay Area; and (3) to the extent possible, improve the quality of water deliveries to municipal and industrial customers without impairing the project's ability to meet the first two objectives.

In 2009, Contra Costa released a public draft environmental impact statement/environmental impact report (EIS/EIR) for expansion alternatives of the dam and reservoir to increase storage up to 275,000 af.

The Contra Costa Board certified a final EIR and approved an expansion from 100,000 af to 160,000 af on March 31, 2010.

In 2011, Contra Costa completed the design and moved forward with construction, which is scheduled for completion in 2012. With additional funding, local, State, and federal partners may choose to continue to study the feasibility of a 275,000 af expansion alternative in the context of other Delta initiatives to improve Delta conveyance and better protect Delta fisheries, including long-term programs being explored in the Bay Delta Conservation Plan.

Shasta Lake Water Resources Investigation

Reclamation, in coordination with other agencies, is studying the feasibility of expanding Shasta Dam and Lake, primarily to promote increased survival of anadromous fish populations in the upper Sacramento River and to increase water supply reliability. An enlargement of Shasta Dam would inundate additional lands around the existing reservoir and affect a portion of the McCloud River. California Public Resources Code Section 5093.542(c), the Wild and Scenic Rivers Act, states that, "except for participation by the Department of Water Resources in studies involving the technical and economic feasibility of enlargement of Shasta Dam, no department or agency of the state shall assist or cooperate with, whether by loan, grant, license, or otherwise, any agency of the federal, state, or local government in the planning or construction of any dam, reservoir, diversion, or other water impoundment facility that could have an

adverse effect on the free-flowing condition of the McCloud River, or on its wild trout fishery.”

The State budget does not include funding for DWR to continue participating in this study. However, Reclamation’s planning is ongoing.

North-of-the-Delta Offstream Storage Investigation

DWR and Reclamation are working in partnership with local, State, and federal agencies to further study north-of-the-Delta offstream storage opportunities. The North-of-the-Delta Offstream Storage Investigation focuses on potential projects on the west side of the Sacramento Valley, including Sites Reservoir.

Storing water in offstream reservoirs during excess flow periods could provide opportunities to increase water storage in an environmentally sensitive manner. The stored water can then be made available to enhance water management flexibility in the Sacramento Valley and the Bay-Delta Estuary, reducing water diversions on the Sacramento River during critical fish migration periods, increasing the reliability of supplies for the Sacramento Valley and statewide, and providing storage and operational flexibility to support environmental enhancement actions and adapt to climate change.

North-of-the-Delta Offstream Storage Investigation studies were ongoing in 2011.

Upper San Joaquin River Basin Storage Investigation

DWR and Reclamation, in coordination with other State and federal agencies, are evaluating opportunities for increased storage in the upper San Joaquin River watershed. The objectives of the Upper San Joaquin River Basin Storage Investigation

are to: (1) increase water supply reliability and operational flexibility in the CVP’s Friant Division, other San Joaquin Valley areas, and other regions, and (2) enhance water temperature and flow conditions in the San Joaquin River in support of San Joaquin River restoration efforts. Other opportunities include additional hydropower generation, reduction of flood damages, water quality improvements, and recreation site development.

In May 2009, Reclamation and DWR released a plan formulation report for the Upper San Joaquin River Basin Storage Investigation that described the alternative formulation, evaluation, and comparison activities that led to selection of Temperance Flat RM 274 Reservoir for detailed feasibility-level evaluation. The report described the progress of the study to date and included additional information on the economics, operations, and costs of Upper San Joaquin River Basin Storage Investigation alternatives. It also defined a set of alternative plans to be considered in the study’s feasibility report and EIS/EIR.

The study continued in 2011 with draft and final feasibility studies and environmental documents scheduled for 2014 and 2015.

Conveyance Program

The Conveyance Program consists of projects proposed in the North and South Delta. These projects are discussed briefly below; more detailed information about the Delta can be found in Chapter 2, Delta Resources.

The SWP obtained federal and California Endangered Species Act coverage through the December 2008 U.S. Fish and Wildlife Service BO for Delta Smelt; the February 2009 Department of Fish and Wildlife incidental take permit (ITP) for Longfin Smelt; and the June 2009 National Marine Fisheries Service (NOAA Fisheries) BO for salmon, steelhead, and Green Sturgeon.

Many of the regulatory requirements will require studies and projects, which were under development in 2010.

Development continued in 2011, including improving existing fish release sites and identifying two new fish release sites; planning a fishing facility and associated predation study for Clifton Court Forebay, evaluating the screening efficiency of Skinner Fish Facility; and evaluating fish screens at Barker Slough Pumping Plant and the Roaring River Slough Distribution System and diversions around Sherman Island. A Fish Science Building is also being planned to hold and rear fish for use in the studies and projects needed to comply with the BOs and the ITP.

North Delta Program

The North Delta Program involves studies related to a through-Delta facility, Delta Cross Channel reoperation, a flow-control facility in the Franks Tract region, and a project to improve flood management and the ecosystem along the Mokelumne River.

In 2009, work on several existing projects was suspended due to the State's fiscal crisis. One of these, *The Delta Regional Salmon Outmigration Study*, had been undertaken as part of the Delta Cross Channel evaluation to address fishery and water quality concerns. The last phase of the field study and subsequent data analysis were not completed.

In 2010 and 2011, efforts were made to resume analysis of data collected in the winter of 2008–2009. Unfortunately, U.S. Geological Survey staff contracted to conduct the study were not readily available to do the analysis. However, it is expected that work will resume in 2012.

The Franks Tract Project involves installation of one or more operable barriers in river channels around the Franks Tract region

to reduce sea water intrusion and enhance conditions for sensitive fish species.

Modeling studies associated with the EIS/EIR for the project were originally conducted using conditions prior to the new BOs and ITP. A sensitivity modeling analysis was completed to assess the benefits of the project on SWP and CVP operations under implementation of the new BOs and ITP, and with or without implementation of the Delta Habitat Conservation and Conveyance Program. Preliminary results showed the Franks Tract Project to be beneficial to water quality even with the new BOs and ITP or with the Delta Habitat Conservation and Conveyance Program.

With the North Delta Flood Control and Ecosystem Restoration Project, solutions to improve flood management and the ecosystem are being considered, including setback levees, detention basins, dredging, and levee degradation for floodplain expansion. For more information about this project, see Chapter 2, Delta Resources.

Scientific and engineering studies continued in 2011.

South Delta

Actions in the South Delta include the South Delta Improvements Program (SDIP), implementing flood control and ecosystem improvements in the lower San Joaquin River, an intertie between the SWP California Aqueduct and CVP's Delta-Mendota Canal, and continuation of DWR's Temporary Barriers Program.

SDIP is a two-stage project. Stage 1 proposes to reduce the movement of San Joaquin River watershed Central Valley fall-run and late fall-run juvenile Chinook Salmon into the South Delta via Old River and to maintain adequate water levels and water quality for agricultural diversions in the South Delta. Stage 2 would increase water deliveries and delivery reliability to SWP and CVP

contractors south of the Delta and increase the maximum permitted level of diversion through the existing intake gates at Clifton Court Forebay.

The SDIP final EIR/EIS (2006) evaluated alternatives and proposed proceeding with SDIP Stage 1. This component involves constructing permanent operable gates and channel dredging in the South Delta. DWR is proposing installation of these permanent gates to replace temporary structures currently installed and removed each year under DWR's Temporary Barriers Program.

Reclamation and DWR's 2008 biological assessment for the SWP and CVP Operations Criteria and Plan included operation of the SDIP permanent operable gates.

The U.S. Fish and Wildlife Service BO, issued in December 2008, concluded that coordinated operations of the CVP and SWP would jeopardize Delta Smelt. The U.S. Fish and Wildlife Service provided a reasonable and prudent alternative under which SDIP could move forward.

The NOAA Fisheries BO, issued in June 2009, concluded that CVP and SWP operations would jeopardize a number of anadromous species, in particular Chinook Salmon. NOAA Fisheries provided no reasonable and prudent alternative for SDIP. DWR initiated discussion with NOAA Fisheries in late 2009 to establish what actions could lead to a reasonable and prudent alternative under which SDIP could move forward; however, NOAA Fisheries stated an interest in holding off on further discussion until completion of an on-going multiyear South Delta Temporary Barriers Program predation study. The study field data collection was completed in 2011. Data from the study will be useful in considering permanent barrier design options and operation strategies to minimize predation.

Any action regarding SDIP Stage 2 will require further study and public input.

Stage 2 planning continued to be suspended in 2011.

Lower Yuba River Accord

The Yuba Accord's purpose is to resolve instream flow issues and protect and enhance lower Yuba River fisheries and local water supply reliability. The Yuba Accord provides revenues for local flood control and water supply projects; water to enhance SWP and CVP water supply reliability by offsetting Delta export reductions for protection and restoration of Delta fisheries; and improvements in statewide water supply management, including dry year supplies for participating SWP and CVP contractors.

The Yuba Accord is based on three agreements, as follows:

- a water purchase agreement with DWR;
- conjunctive use agreements with Yuba County Water Agency member units; and
- a fisheries agreement.

The three Yuba Accord agreements were executed in late 2007 and early 2008, and the SWRCB approved the Yuba Accord in March 2008, setting flow schedules for the Yuba River and authorizing accord-based water transfers through 2015.

The water purchase agreement transfers water to help offset Delta export reductions annually and provides dry year transfer water for SWP and CVP contractors from surface and groundwater substitution sources.

Due to the wet hydrology in 2011, excess conditions in the Sacramento-San Joaquin Delta prevented accounting of Yuba County Water Agency releases as transfer water for the entire summer transfer season.

For additional details about the Yuba Accord, see Chapter 9, Water Contracts and Deliveries.

Chapter 8 Water Supply

In southern Kern County, the California Aqueduct emerges from the Porter Tunnel and splits into the West and East branches.

Significant Events in 2011

Water year 2010–2011 proved to be significantly wet, with above-average precipitation and mountain snowpack. The State received precipitation at 135 percent of average in 2010–2011, compared to 108 percent of average in 2009–2010. The Northern Sierra 8-Station Precipitation Index recorded the wettest June precipitation totals on record. The statewide snowpack peaked at the end of March and then gradually declined as April was unusually cool and dry.

Statewide river runoff totaled 146 percent of average in the 2010–2011 water year. Runoff in the Sacramento River and San Joaquin River regions was 135 and 184 percent of average, respectively. Feather River unimpaired inflow to Lake Oroville was 6.6 million acre-feet (maf) (145 percent of average) for the water year, compared to 3.6 maf (79 percent of average) the previous year.

The Sacramento Valley Water Year Hydrologic Classification (Sacramento Valley 40-30-30 Index) and the San Joaquin Valley Water Year Hydrologic Classification (San Joaquin Valley 60-20-20 Index) were both considered “wet,” based on all observed data for water year 2010–2011.

Information in this chapter was contributed by the Division of Flood Management and the Division of Operations and Maintenance.

The Department of Water Resources (DWR) monitors precipitation, calculates runoff, and operates storage facilities during each water year. The official California water year runs from October 1 through September 30. DWR works during the water year to fulfill its key contractual obligations to the State Water Project (SWP) long-term water supply contractors.

Water Year 2010–2011

Precipitation and Snowpack

California experienced above-average rainfall and mountain snowpack during water year 2010–2011. The state received precipitation at 135 percent of average in 2010–2011, compared to 108 percent of average in 2009–2010. Figure 8-1 presents water year precipitation for the various regions of the state. The Northern Sierra 8-Station Precipitation Index (for more about this, see the sidebar, Precipitation and Water Supply Indices) finished the water year with 72.7 inches of precipitation, which was 145 percent of average. The statewide average snow water equivalent, based on snow sensors, reported for April 1 was 47.7 inches, or 165 percent of average. Historically, April 1 is the average annual date of peak snow accumulation.

Table 8-1 presents monthly precipitation totals for water year 2010–2011 at various gauges located throughout the state, listed north to south. For much of the state, the two wettest months were December and March, where precipitation totals exceeded 150 percent of average.

Mount Shasta City in far Northern California received 51.1 inches of precipitation for a water year total that was 141 percent of average. Precipitation for Mount Shasta City was above normal for 7 months of the 2010–2011 water year. March accumulated the largest precipitation and percent of normal for the water year, with 16.1 inches and 367 percent, respectively. December's and March's large precipitation averages

were due to several major storms that occurred throughout the state, which brought significant amounts of rain and snowfall accumulation in the Sierra with windy conditions.

Blue Canyon experienced precipitation above normal for 8 months of water year 2010–2011. The month of March accumulated the largest precipitation and percent of normal for the water year, 25.8 inches, which was 304 percent of average. The month of June was the greatest percent of normal for the water year with 541 percent, which was 4.8 inches of precipitation.

The monthly totals for the Northern Sierra 8-Station Precipitation Index for the water year are presented in Table 8-2. Precipitation totaled 72.7 inches, which was 145 percent of average. Monthly precipitation totals for October and March, May, and June were well above average at 250, 271, 219, and 318 percent of average, respectively. March and June registered as the second and first, respectively, wettest months on record for the index. Following the wet June, the rest of the water year was quite dry and warm.

Taking the entire water year into consideration, 48 percent of the water year total precipitation fell during December and March, essentially during two storm periods. The first period of storms occurred during December, producing 16.4 inches of precipitation for the Northern Sierra 8-Station index. The month started cool and dry with high-pressure offshore, and by the end of the first week a low-pressure system brought widespread precipitation

Figure 8-1 Statewide Precipitation by Hydrologic Region, 2010–2011 Water Year, as Percent of Average

and mountain snow. By the end of the second week, a series of strong storms occurred throughout the state. The wet conditions were unusual for what is typical for La Niña conditions in the tropical Pacific. The second series of storms hit California in March, producing 18.7 inches of precipitation for the index. March started with dry conditions throughout most of the state, but by the middle of the first week, a storm system traveled throughout California. High precipitation led to localized flooding, while snow fell at low elevations. The storm systems in the fourth week included thunderstorms, hail, and a few small tornadoes.

Areas of the Central Valley received above-normal precipitation for the months of March, May, and June. Precipitation totals for

those months were 7.0, 1.4, and 1.1 inches, respectively, for Sacramento (293, 304, and 877 percent of average) and 3.5, 0.4, and 1.9 inches, respectively, for Fresno (187, 125, and 2,729 percent of average).

In the San Joaquin and Tulare Lake watersheds, precipitation in March comparable to the precipitation in the north. The March storms brought 268 percent of average precipitation at Yosemite Headquarters and 172 percent of average at Grant Grove. Water year precipitation totals at those two sites were above average with 165 and 143 percent for their respective annual averages. Further south, the cities of Los Angeles and San Diego were above average, totaling 140 and 122 percent of their annual averages for the water year, respectively.

The precipitation that fell during water year 2010–2011 resulted in a snowpack above average throughout the state’s mountainous regions. Monthly statewide snowpack for the water year is shown in Table 8-3. Snow water equivalents shown in the table were obtained from daily snow sensor reports corresponding to the first day of each month. The statewide average snow water equivalent reported for April 1 was 47.7 inches or 165 percent of average. Snowpack peaked at the end of March at approximately 48 inches of snow water content. The snowpack peaked slightly earlier than normal at 166 percent of average. April 1 is typically the average annual date of peak snow accumulation. June 1 had the greatest percent of average snow levels for the year, with 313.

Runoff and Storage

Statewide unimpaired runoff totaled 146 percent of average in the 2010–2011 water year. The monthly runoff totals for the Sacramento 4 Rivers, San Joaquin 4 Rivers, Tulare Lake 4 Rivers, and the Feather River are shown in Table 8-4. The

Table 8-3 Statewide Snowpack for Water Year 2010–2011

	Date	Snow Water Equivalent (inches)	Percent of Average	Percent of April 1 Average ^a

	September 1	0	0	0

^a April 1 is the average date of peak statewide snowpack. This table is based on snow pillow (a device for measuring snowpack at automated reporting stations) data.

water year runoff totals for these regions were 135, 184, 192, and 142 percent of average, respectively.

From a water supply perspective, the most closely monitored period is April through July. April concluded with 163, 164, 190, and 179 percent of normal runoff for the Sacramento River, San Joaquin River, Tulare Lake regions, and the Feather River, respectively. By the end of July, the April–July runoff volumes had increased to 177, 181, 192, and 191 percent of average, respectively.

The Sacramento Valley Water Year Hydrologic Classification (Sacramento Valley 40-30-30 Index) and the San Joaquin Valley Water Year Hydrologic Classification (San Joaquin Valley 60-20-20 Index) were both considered “wet,” based on all observed data for water year 2010–2011. (For more information about the hydrologic classifications, see the sidebar, Precipitation and Water Supply Indices.)

WY: Water Year (October 1–September 30)

During water year 2010–2011, statewide reservoir storage peaked near 130 percent of average in August following the near average 2009–2010 water year. Monthly storage totals for the major Sierra reservoirs are shown in Table 8-5. End-of-water-year storage in the major Sierra reservoirs ranged from 182 percent of average in the Pine Flat Reservoir on the Kings River to 84 percent of average in Kaweah Reservoir on the Kaweah River.

Water Year 2011–2012 October through December Water Conditions

The last three months of calendar year 2011 mark the beginning of a new water year, 2011–2012, as shown in Table 8-1. October proved to be above average for precipitation throughout the state. Grant Grove received 209 percent of average precipitation during October. By comparison, November and December were drier statewide and well below average for precipitation. December had extremely low precipitation, ranging

from 2.2 inches in Eureka to no precipitation in the central and southern regions.

At the end of October, water year runoff totals were 111, 238, and 253 percent of average for the Sacramento River, San Joaquin River, and Tulare Lake regions, respectively. By the end of December, runoff totals for the new water year were 49, 60, and 114 percent of average, respectively, for the same three regions.

State Water Project Storage

SWP operates a complex system of dams, canals, and reservoirs to collect and store water for future deliveries. Lake Oroville is the first of two primary SWP conservation facilities. Lake Oroville inflow comes from tributaries of the Feather River.

The San Luis Reservoir is the second primary SWP conservation facility. This Central California joint-use facility derives its inflow from pumping at the Gianelli Pumping-Generating Plant. San Luis is an off-stream storage reservoir. Most of the water is

Precipitation and Water Supply Indices

Northern Sierra 8-Station Precipitation Index

In the northern Sierra Nevada, precipitation is indexed by averaging rain gauge totals at eight representative stations, creating what is known as the Northern Sierra 8-Station Precipitation Index. The eight stations are: Mount Shasta City, Shasta Dam, Mineral, Quincy, Brush Creek, Sierraville Ranger Station, Blue Canyon, and Pacific House. The index provides a representative sample of the major watersheds (upper Sacramento, Feather, Yuba, and American rivers) and serves as a wetness index for the Sacramento River hydrologic region.

Sacramento River Runoff

Sacramento River runoff (Sacramento 4 Rivers) is the sum of unimpaired flow in million acre-feet (maf) at the Sacramento River above Bend Bridge, Feather River at Oroville (inflow to Lake Oroville), Yuba River near Smartville, and American River below Folsom Lake. The Sacramento Valley unimpaired runoff represents the natural water production of the Sacramento River basin, unaltered by upstream diversions, storage, or export of water to or import of water from other basins.

Also known as the “Sacramento River Index,” this index was previously used to determine year type classifications under State Water Resources Control Board (SWRCB) Water Right Decision 1485.

Eight River Index

This index is the sum of the unimpaired runoff from eight rivers—four in the Sacramento Valley (Sacramento River Runoff) and four in the San Joaquin Valley: the Stanislaus River below Goodwin Dam, Tuolumne River below La Grange, Merced River below Merced Falls, and San Joaquin River below Millerton Lake.

This index determines the duration of the fish and wildlife salinity and flow standards at Chipps Island or Port Chicago from February through June.

Sacramento Valley 40-30-30 Index

SWRCB Water Right Decision 1641 (D-1641) applies the Sacramento Valley Water Year Hydrologic Classification (Sacramento Valley 40-30-30 Index), a water supply forecasting tool, to derive the water year type for the Sacramento Valley. Previously, the Sacramento River Index was used to classify water years. SWRCB first introduced the Sacramento Valley 40-30-30 Index in the 1991 Water Quality Control Plan for the San Francisco Bay/Sacramento-San Joaquin Delta Estuary (Bay-Delta Plan), and continued using it with the 1995 Bay-Delta Plan. D-1641 implements portions of the 1995 Bay-Delta Plan with respect to the operation of the State Water Project and the Central Valley Project. The Sacramento Valley 40-30-30 Index is used to determine the Sacramento Valley water year type for the purpose of implementing water quality objectives defined in D-1641. It also provides an estimate of the potential water supply originating in the basin from rainfall and snowmelt runoff, groundwater accretion, and reservoir carryover storage. The Sacramento Valley 40-30-30 Index incorporates seasonal differences in water contribution for the year

and includes the prior year’s conditions in order to establish a more reliable index of water availability. The 40-30-30 factors represent the percentage weight given to the following:

- (1) 40%—the current year’s April through July Sacramento Valley unimpaired runoff;
- (2) 30%—the current year’s October through March Sacramento Valley unimpaired runoff; and
- (3) 30%—the previous year’s index with a cap of 10 maf (to account for required flood control reservoir releases during wet years).

The water year type is determined by the index value on a scale specific to the Sacramento Valley (as defined in D-1641).

Classification	Index (million acre-feet)
Wet	Equal to or greater than 9.2
Above Normal	Greater than 7.8 and less than 9.2
Below Normal	Equal to or less than 7.8 and greater than 6.5
Dry	Equal to or less than 6.5 and greater than 5.4
Critical	Equal to or less than 5.4

Water year types are set by the first-of-the-month forecasts beginning in February, and the Sacramento Valley 40-30-30 Index May 1 forecast determines the final water year type for implementing water quality and flow requirements contained in D-1641. The D-1641 objectives are conditioned by water year type and generally become less stringent during dryer years.

San Joaquin Valley 60-20-20 Index

D-1641 uses a similar method to determine the water year type for the San Joaquin Valley. The San Joaquin Valley Water Year Hydrologic Classification (San Joaquin Valley 60-20-20 Index) uses (1) the current year’s April through July San Joaquin Valley unimpaired runoff (60 percent); (2) the current year’s October through March San Joaquin Valley unimpaired runoff (20 percent); and (3) the previous year’s San Joaquin Valley 60-20-20 Index (20 percent, with a cap of 4 maf to account for required flood control reservoir releases during wet years).

The water year type is determined by the index value on a scale specific to the San Joaquin Valley (as defined in D-1641).

Classification	Index (million acre-feet)
Wet	Equal to or greater than 3.8
Above Normal	Greater than 3.1 and less than 3.8
Below Normal	Equal to or less than 3.1 and greater than 2.5
Dry	Equal to or less than 2.5 and greater than 2.1
Critical	Equal to or less than 2.1

The San Joaquin Valley 60-20-20 Index May 1 forecast determines the water year type for D-1641 San Joaquin River Vernalis flow standards.

pumped into the reservoir from late fall to early spring. This water is temporarily stored, then released into the California Aqueduct to meet water contractor peaking demands in the summer months. The remaining SWP dams and reservoirs regulate the stored water supply in delivery patterns that are designed to fit local water demands.

Water Year 2010–2011 Storage Totals

At the end of the 2010–2011 water year, water storage in major SWP reservoirs and the State's share of joint-use reservoirs was 4.64 million acre-feet (maf) or 85 percent of maximum storage, compared to 2.81 maf

or 52 percent of maximum storage at the end of water year 2009–2010. The average end-of-month total storage for the 2010–2011 water year in major SWP reservoirs was 4.27 maf. End-of-water-year storage on September 30, 2011, at Lake Oroville was 3.05 maf, which was about 1.29 maf more than the previous water year. The State's share of San Luis Reservoir storage at the end of the 2010–2011 water year was 874,062 acre-feet (af), compared with 414,277 af in the previous water year. The combined storage in southern reservoirs was 584,945 af on September 30, 2011, compared with 555,202 af at the end of the 2009–2010 water year.

Calendar Year 2011 Storage Totals

The total storage in major SWP reservoirs was about 4.10 maf at the end of 2011, compared with 3.58 maf in 2010. The State's share of San Luis Reservoir storage was 964,240 af on December 31, 2011, compared with 802,515 af at the same time in 2010. The combined storage in the southern reservoirs was 586,234 af on December 31, 2011, compared with 601,004 af at the same time in 2010.

Lake Oroville

Lake Oroville has a maximum water storage capacity of 3,537,580 af. Runoff from the upper Feather River drainage, collected and stored in this reservoir, is released to the Sacramento-San Joaquin Delta through Oroville Dam, Thermalito Diversion Dam, and Thermalito Afterbay.

Water Year 2010–2011 Inflow

Lake Oroville inflow for the 2010–2011 water year totaled about 6.23 maf, which was 147 percent of the average (4.24 maf) over the last 30 water years. Maximum daily inflow occurred on March 16, 2011, at 80,483 af. Minimum daily inflow occurred on September 22, 2011, at 64 af. Peak monthly total inflow occurred in April at 1,069,402 af, 17.2 percent of the water year total. The maximum total in the last 30 water years (1982–2011) was in water year 1982–1983 at 8,853,572 af. The minimum total in the same period was in water year 1991–1992 at 1,555,774 af.

Calendar Year 2011 Inflow

Figure 8-2 shows monthly Lake Oroville inflow for calendar years 2009, 2010, and 2011. Total Lake Oroville inflow during the calendar year was 5,661,437 af.

Figure 8-2 Monthly Inflow into Lake Oroville from the Feather River, 2009–2011 Calendar Years

Figure 8-3 shows historical (over the last 30 years) maximum and minimum cumulative Lake Oroville inflow for calendar years 1983 and 1994, and current cumulative inflow for 2011.

Calendar Year 2011 Storage

Minimum storage occurred on January 1, 2011, at 2,195,015 af, 62 percent of lake capacity. Maximum storage occurred on June 25, 2011, at 3,538,841 af, 100 percent of lake capacity. End-of-year Lake Oroville storage was 2,544,964 af.

Figure 8-4 compares end-of-month storage in Lake Oroville for the 2010 and 2011 calendar years.

2010–2011 Water Year San Luis Reservoir Operations

San Luis Reservoir is operated jointly by DWR and the Bureau of Reclamation pursuant to operating procedures adopted in

June 1981. San Luis Reservoir has a normal operating capacity of 2,027,840 af. The SWP share of this capacity is 1,062,183 af.

San Luis Reservoir reached its maximum water year total storage on March 26, 2011, at 2,035,210 af, 100 percent of its normal maximum operating capacity. At the beginning of the water year, San Luis Reservoir contained 788,588 af, 39 percent of its capacity. SWP storage share at the beginning of the water year was 414,277 af. The highest end-of-month SWP share of water storage for the 2010–2011 water year occurred on March 31, 2011, at 1,067,644 af. (See Figure 8-5.)

2010–2011 Water Year Lake del Valle Operations

Lake del Valle, located off the South Bay Aqueduct, functions primarily as a storage facility for water delivery to Santa Clara and Alameda counties. At the beginning of the water year, Lake del Valle held 36,194 af,

Figure 8-3 Lake Oroville Cumulative Inflow—Current and Historical (1982–2011) Maximum and Minimum

Figure 8-4 End-of-Month Storage in Lake Oroville, 2010 and 2011 Calendar Years

Figure 8-5 End-of-Month Storage in San Luis Reservoir, 2010 and 2011 Calendar Years

which was about 47 percent of its maximum capacity of 77,111 af. Its highest storage during the 2010–2011 water year occurred on June 10, 2011, at 41,244 af. Its lowest storage occurred on December 30, 2010, at 30,627 af.

By the end of the water year, on September 30, 2011, storage in Lake del Valle was 38,862 af, 50 percent of its maximum capacity. There was 33,044 af of natural inflow into Lake del Valle, and 2,862 af of inflow from the South Bay Aqueduct. There were 12,601 af of releases to Arroyo Valle, and releases for the water year to the South Bay Aqueduct from Lake del Valle totaled 17,751 af.

2010–2011 Water Year Southern Reservoir Operations

During normal operating conditions, DWR maintains its four southern reservoirs—Pyramid, Castaic, Silverwood, and Perris—at or near full operating capacity to ensure uninterrupted delivery of water to Southern California SWP contractors.

At the beginning of the water year, these reservoirs held 555,202 af, which is 81 percent of their combined normal maximum operating capacity of 689,021 af. At the end of the water year, the reservoirs held 584,945 af, 85 percent of combined normal maximum operating capacity.

Diversions from the Delta

The SWP diverts water from the Sacramento-San Joaquin Delta, through the Banks and Barker Slough pumping plants, for delivery to SWP water contractors' storage facilities. The Central Valley Project (CVP) diverts water to similar areas from the Delta through Jones Pumping Plant and Contra Costa Pumping Plant.

In 2011, the SWP diverted 3,879,762 af at Banks Pumping Plant. There was no Cross Valley Canal water or CVP water wheeled

at Banks Pumping Plant by DWR during calendar year 2011. The CVP diverted 2,475,437 af at Jones Pumping Plant and 100,140 af at Contra Costa Pumping Plant. The combined Delta exports include all of these plants. Figure 8-6 shows the amounts of water pumped each month in 2011 at Banks Pumping Plant. Figure 8-7 shows the monthly amounts of water diverted from the Delta in 2011 by the SWP and CVP.

Water is delivered from Banks Pumping Plant to the South Bay Area through the South Bay Aqueduct, and to the San Joaquin Valley, Central Coastal, and Southern California areas through the California Aqueduct. The SWP diverts water from Barker Slough Pumping Plant to the North Bay Aqueduct. In calendar year 2011, the North Bay Aqueduct received 40,112 af of water from the Barker Slough Pumping Plant.

Dos Amigos Pumping Plant diverts water from O'Neill Forebay to the California Aqueduct. Figure 8-8 shows monthly total amounts pumped at Dos Amigos Pumping Plant for calendar year 2011. The monthly total amount pumped at Dos Amigos Pumping Plant peaked in July 2011 at 648,115 af for the calendar year.

Maximum daily Delta exports occurred on January 8, 2011, at 25,129 af. Combined SWP and CVP monthly Delta exports in 2011 varied from a low of 210,509 af in May, to a high of 708,463 af in August. In 2011, Delta exports totaled approximately 6.5 maf.

In 2011, water pumped through the Edmonston Pumping Plant for delivery to Southern California totaled 1,682,759 af. Figure 8-9 shows the amount of water pumped each month in calendar year 2011.

Additional water supply information can be found on DWR's website.

Chapter 9

Water Contracts and Deliveries

Quail Lake and Canal.

Significant Events in 2011

The hydrologic conditions were classified as “wet” in both the Sacramento River watershed and in the San Joaquin River watershed in 2011. As a result, the Department of Water Resources (DWR) approved 80 percent of the State Water Project (SWP) water contractors’ Table A allocation requests, totaling 3,338,000 acre-feet (af).

The Article 21 Water Program allows SWP water contractors to take delivery of water exceeding the approved and scheduled Table A amounts. In 2011, a total of 420,814 af of Article 21 water was delivered to 10 SWP water contractors.

In 2011, a total of 4,630,798 af of State Water Project (SWP) and non-SWP water was delivered to 29 long-term SWP water contractors and 24 other agencies. The portion delivered to SWP water contractors was 3,348,931 af; the portion to non-SWP agencies was 1,281,867 af.

Information for this chapter was provided by the State Water Project Analysis Office.

The long-term water supply contracts between the Department of Water Resources (DWR) and 29 public agencies and local water districts provide for water service from the State Water Project (SWP) and are the basis for the SWP's construction and on-going operations. The State provides SWP financing, capital construction, improvements, and all operations and maintenance of SWP facilities, and the agencies and local districts have contractually agreed to repay all associated costs.

The water supply contracts also set forth the maximum amount of water a contractor may request each year from the SWP, and these water amounts are written within the contracts in a list format known as Table A. "Table A" or "Table A water" represents a portion or all of the annual Table A requested by SWP water contractors and approved for delivery by DWR based on hydrologic conditions, current reservoir storage, and combined requests from the SWP water contractors. Under certain conditions, DWR is not able to deliver the quantity of water requested by contractors. In these years, a proportional amount is allocated and delivered according to the long-term water supply contracts by prorating the amount in proportion to each SWP water contractor's maximum Table A amount. Table A amounts may also be used as a factor to allocate other available water supplies to each contractor. Approved Table A amounts may also be referred to in this chapter as "approved amounts," "approved water," or "allocated water."

The long-term water supply contracts are amended as needed.

DWR also enters into agreements with SWP water contractors and other agencies, which may be amended periodically, to convey SWP and non-SWP water through the California Aqueduct and to approve the construction, operation, and maintenance of SWP facilities and turnouts/turn-ins. These agreements are also listed in this chapter.

The State Water Project Analysis Office (SWPAO) developed a numbering system for contracts, amendments, and agreements executed by DWR. These numbers, referred to as SWPAO numbers, are designated in Chapter 9 text as "SWPAO #XXXXX" and are located in parentheses after each contract, amendment, or agreement description. These numbers can be used as an identifier for anyone who contacts DWR staff for more detailed information on a particular document.

Amendments to Long-term SWP Water Supply Contracts

All the original long-term water supply contracts signed by DWR, public agencies, and local water districts have been previously amended to incorporate mutually desired changes. Most amendments fall under the following general categories:

- (1) permanent transfers of Table A amounts from one SWP water contractor to another;
- (2) allocation of costs and benefits for the addition or enlargement of SWP facilities;
- (3) purchase of excess capacity in the California Aqueduct; and
- (4) provisions to implement Monterey Agreement principles.

State Water Project Long-term Water Supply Contracts

The first water supply contract was signed with The Metropolitan Water District of Southern California (Metropolitan) on November 4, 1960. The contract was negotiated by the Department of Water Resources (DWR) and Metropolitan according to terms of the contracting principles for water service contracts announced by the Governor on January 20, 1960.

The Metropolitan contract became the prototype for all water contracts; by the end of 1967, 31 agencies had contracted for water. In addition, a water supply contract was executed with the City of West Covina in December 1963, but was terminated in August 1965; the city's Table A amount was transferred to Metropolitan through an amendment to the district's long-term contract with DWR. Long-term contracts with Hacienda Water District and Devil's Den Water District were also terminated when those districts transferred their Table A amounts, through contract amendments, to Tulare Lake Basin Water Storage District (1981) and Castaic Lake Water Agency (1992), respectively. Today the State Water Project (SWP) has long-term water supply contracts with 29 agencies. Those contracts have been amended periodically to incorporate mutually agreed upon modifications.

All water contracts signed in the 1960s included an estimate of the date water would first be delivered and a schedule of the amount of water the agency could expect to be delivered annually (annual Table A amounts). That amount was designed to increase gradually until the maximum amount of annual Table A was reached. The total combined maximum annual Table A amount for all water contracting agencies was initially 4,230,000 acre-feet (af), assuming full development of the SWP.

The contracts were initially designed to be valid for 75 years or until all bonds sold as part of the California Water Resources Development Bond Act were repaid, whichever period was longer. As a result of amendments to contracts in the 1990s, the current combined maximum annual Table A amount totals 4,172,786 af, and the contracts are in effect for the longest of the following periods: (1) the project repayment period, which extends to 2035; (2) 75 years from the date of the contract; or (3) the period ending with the latest maturity date of any bond used to finance the construction costs of project facilities.

2011 Amendments to Long-term Water Supply Contracts

There were no amendments to the long-term water supply contracts in 2011.

Monterey Amendments

The Monterey Amendments increase the reliability of existing water supplies, and increase water management flexibility,

providing more tools for local water agencies to maximize use of existing facilities.

The Monterey Amendments include changes in allocation of Table A water, the transfer of Table A amounts and land, financial restructuring, and increased operational flexibility. The Monterey Amendments are discussed in detail in Chapter 1, Summary of Significant Events, Bulletin 132-95, found on the DWR website.

Plumas County Flood Control and Water Conservation District (Plumas) and Empire-West Side Irrigation District (Empire) remain the only long-term SWP water contractors who have not signed the Monterey Amendments.

In accordance with the terms of the May 5, 2003, Monterey Settlement Agreement, the SWP continues to operate pursuant to the Monterey Amendments while the new environmental impact report (EIR) is being prepared. The draft EIR was released in October 2007 and is available on DWR's website. The final EIR was released in February 2010, and a notice of determination to proceed with the project was filed in June 2010. DWR's decision was to continue to operate the SWP under the existing Monterey Amendments pursuant to the SWP long-term water supply contracts, including the Kern Water Bank transfer, and under the settlement agreement entered in the Planning and Conservation League (PCL) v. DWR lawsuit. DWR's decision was challenged by two groups of plaintiffs on issues relating to the adequacy of the EIR and the validity of the Monterey Amendments. The cases are currently being heard by the trial court. Final resolution of the issues is likely to take a number of years.

The settlement agreement is discussed in detail in Chapter 9, Water Contracts and Deliveries, Bulletin 132-04 (available on DWR's website).

See Chapter 6, Legislation and Litigation, for the current status of the Monterey Amendment litigation.

Miscellaneous Agreements with Long-term SWP Water Contractors

2011 Water Conveyance and Exchange Agreements

Water conveyance and exchange agreements that were executed or pending execution with long-term SWP water contractors during 2011 are described below.

Alameda County Flood Control and Water Conservation District, Zone 7

An amendment executed April 21, 2011, to the 2000 point of delivery agreement among DWR, Kern County Water Agency (Kern), and Alameda County Flood Control and Water Conservation District, Zone 7 (Alameda-Zone 7), extends the term for the recovery of Alameda-Zone 7's stored water to December 31, 2035. The 2000 point of delivery agreement (SWPAO #00037) approved the delivery of a portion of Alameda-Zone 7's 2000 approved SWP water supplies for storage under the Semitropic Water Banking and Exchange Program, and the delivery for the return of the stored water to Alameda-Zone 7 by December 31, 2010. No water was moved under this agreement in 2011. (SWPAO #00037-A)

Alameda County Water District

A long-term point of delivery agreement executed March 16, 2011, among DWR, Alameda County Water District (Alameda County), and Kern, provides for the delivery of a portion of Alameda County's approved SWP water supplies to Kern for storage under the Semitropic Groundwater Banking and Exchange Program. The agreement allows delivery to storage in the groundwater basin underlying Semitropic Water Storage District (Semitropic) through December 31, 2020, and return of the stored water to Alameda County by December 31, 2035. During 2011, a total of 21,400 acre-feet (af)

of Alameda County's SWP water was delivered to storage, of which 13,000 af was Table A water, 5,380 af was Article 56(c) water, 1,061 af was Article 14(b) water, and 1,959 af was Article 21 water. (SWPAO #10009)

Castaic Lake Water Agency

An amendment executed November 3, 2011, to the 2002 point of delivery agreement among DWR, Castaic Lake Water Agency (Castaic Lake), and Kern, extends the term for the recovery of Castaic Lake's stored water in Semitropic to December 31, 2022. The 2002 point of delivery agreement (SWPAO #02015) allowed Castaic Lake to store up to 24,000 af of its 2002 Table A water under the Semitropic Water Banking and Exchange Program, and to recover the stored water by December 31, 2012. No water was moved under this agreement in 2011. (SWPAO #02015-A)

An amendment executed November 3, 2011, to the 2003 point of delivery agreement among DWR, Castaic Lake, and Kern, extends the term for the recovery of Castaic Lake's stored water in Semitropic to March 31, 2024. The 2003 point of delivery agreement (SWPAO #03060) allowed Castaic Lake to store up to 35,000 af of its 2003 Table A water under the Semitropic Water Banking and Exchange Program, and to recover the stored water by March 31, 2014. No water was moved under this agreement in 2011. (SWPAO #03060-A)

A letter agreement dated March 17, 2011, and executed August 22, 2011, among DWR, Castaic Lake and Kern, provides for the delivery of up to 19,000 af of Castaic Lake's approved SWP water supplies to Kern before December 31, 2011. In exchange, Kern will return 50 percent of the total amount of water delivered to Kern, up to 9,500 af of its future approved SWP water supplies, to Castaic Lake by December 31, 2021. During 2011, a total of 5,608 af of Castaic Lake's

Article 56(c) water was delivered to Kern. (SWPAO #11010)

A letter agreement pending execution among DWR, Castaic Lake, and Kern, will provide for the delivery of up to 5,000 af of Castaic Lake's approved SWP water supplies to Kern through December 31, 2012. In exchange, Kern will return 50 percent of the total amount delivered to Kern, up to 2,500 af of its future SWP water supplies, to Castaic Lake by December 31, 2022. During 2011, a total of 5,000 af of Castaic Lake's Table A water was delivered to Kern. (SWPAO #11016)

Dudley Ridge Water District

A multiyear exchange agreement executed March 14, 2011, among DWR, Dudley Ridge Water District (Dudley Ridge) and Kern, approves multiyear water exchanges and same landowner transfers between Dudley Ridge and Kern through December 31, 2020. This agreement allows for the delivery of a portion of either: (1) Dudley Ridge's or Kern's approved Table A water to the other party in exchange for the return of future Table A water, or (2) Dudley Ridge's and/or Kern's approved Table A water for same landowner transfer to the other party without any expected return. Dudley Ridge and Kern will establish an Exchange Account to track the water deliveries to Dudley Ridge and/or Kern under this agreement on a yearly basis. No water was moved under this agreement in 2011. (SWPAO #10007)

A multiyear same landowner transfer agreement executed June 13, 2011, among DWR, Dudley Ridge and Kern, provides for the delivery of a portion of Dudley Ridge's approved Table A water for same landowner transfers to Kern without any expected return through December 31, 2020. During 2011, a total of 3,400 af of Dudley Ridge's Table A water was delivered to Kern. (SWPAO #10030)

Empire-West Side Irrigation District

A long-term change in place of use agreement executed March 3, 2011, among DWR, Empire-West Side Irrigation District (Empire) and Westlands Water District (Westlands), approves annual delivery of up to 2,000 af of Empire's Table A water to Westlands through April 1, 2027. This transfer was made on behalf of two landowners, Brooks Farms and Newton Brothers, who farm in both Empire and Westlands' service areas. DWR petitioned the State Water Resources Control Board (SWRCB) for a temporary change in place of use. The SWRCB issued an order approving the petition on November 21, 2011. No water was delivered to Westlands under this agreement in 2011. (SWPAO #10008)

A contract executed February 25, 2011, between DWR and Empire, provided for the delivery of unscheduled water to Empire in 2011 at times when SWP water is not needed for fulfilling Table A deliveries or for meeting project operational commitments. During 2011, a total of 138 af of unscheduled water was delivered to Empire. (SWPAO #11001)

A letter agreement dated April 7, 2011, and executed April 13, 2011, between DWR and Empire, approved the transfer of up to 2,000 af of Empire's 2011 Table A water to Westlands. The transfer was made on behalf of landowners, Brooks Farms and Newton Brothers, who farm in both Empire's and Westlands' service areas. DWR petitioned SWRCB for a temporary change in place of use. The SWRCB issued Order WR 2011-0010-DWR approving the petition on April 1, 2011, for the transfer in 2011 only. For subsequent years, a long-term agreement providing for the same landowner transfer is described above (SWPAO #10008). During 2011, a total of 400 af of Empire's Table A was delivered to Westlands under this agreement. (SWPAO #11009)

Kern County Water Agency

A multiyear conveyance agreement executed December 14, 2011, among DWR, Kern and City of Tracy (Tracy), provides for the conveyance of up to 10,500 af per year of Tracy's Central Valley Project (CVP) water to Kern for storage under the Semitropic Water Banking and Exchange Program through December 31, 2029. In exchange, Kern will return up to 3,500 af annually of its Table A water to Tracy through December 31, 2030. No water was delivered to Kern under this agreement in 2011. (SWPAO #10031)

A letter agreement dated July 15, 2011, and executed August 19, 2011, between DWR and Kern, approves the conveyance of up to 53,300 af of Kern-Tulare Water District's (Kern-Tulare) 2011 (CVP water to Kern under Article 55 of Kern's long-term water supply contract, effective March 1, 2011, through February 29, 2012. No water was delivered to Kern under this agreement in 2011. (SWPAO #11002)

A letter agreement dated December 15, 2010, and executed February 11, 2011, between DWR and Kern, provided for the conveyance of up to 7,000 af of Kern's 2010 Table A water for use at the Kern National Wildlife Refuge on behalf of the Bureau of Reclamation (Reclamation). This agreement completed the exchange that began with Reclamation acquiring Kern-Tulare's Friant-Kern water previously stored in Rosedale-Rio Bravo Water Storage District (Rosedale-Rio), a member unit of Kern. The conveyance was completed in December 2010. (SWPAO #10026)

A letter agreement dated November 4, 2011, and executed December 6, 2011, between DWR and Kern, provided for the conveyance of up to 25,000 af of Friant Recirculation Water associated with the San Joaquin River Restoration Program to Kern. Four member units of Kern purchased this nonproject water from the Friant Division

CVP contractors to firm up their future in-district supplies. Reclamation made this nonproject water available at O'Neill Forebay for DWR to convey to Kern under Article 55 of Kern's long-term water supply contract. During 2011, a total of 18,018 af of water was delivered to Kern under this agreement. (SWPAO #11017)

Littlerock Creek Irrigation District

A letter agreement dated January 12, 2011, and executed January 24, 2011, among DWR, Littlerock Creek Irrigation District (Littlerock), and Antelope Valley-East Kern Water Agency (AVEK), approves an exchange of up to 1,150 af of Littlerock's 2010 Table A water with AVEK's future allocated Table A water. AVEK will return an equal amount of its future Table A water to Littlerock by December 31, 2020. No water was moved under this agreement in 2011. (SWPAO #10035)

The Metropolitan Water District of Southern California

A letter agreement dated March 9, 2011, and executed April 5, 2011, among DWR, The Metropolitan Water District of Southern California (Metropolitan), and Santa Clara Valley Water District (Santa Clara), approves the delivery of up to 9,000 af of Santa Clara's 2010 Table A, Article 56(c) water stored in San Luis Reservoir to Metropolitan. In exchange, Metropolitan will return an equal amount of its future Table A water to Santa Clara by December 31, 2014. During 2011, a total of 8,341 af of Santa Clara's Article 56(c) water was delivered to Metropolitan. (SWPAO #11007)

A change in point of delivery agreement executed September 8, 2011, among DWR, Metropolitan, and Mojave Water Agency (Mojave), provides for the delivery of up to 390,000 af of Metropolitan's approved SWP water supplies to Mojave for temporary storage in the Mojave River Basin, and for the equivalent return of such water by in-lieu

exchange of Mojave's approved SWP water supplies. The agreement allows deliveries of Metropolitan's water to Mojave through December 31, 2034, and return of stored water to Metropolitan by December 31, 2035. During 2011, a total of 45,048 af of Metropolitan's Table A water was delivered to Mojave. (SWPAO #11011)

Palmdale Water District

A letter agreement pending execution among DWR, Palmdale Water District (Palmdale), and AVEK, provides for the delivery of up to 10,000 af of Palmdale's 2011 SWP water supplies to AVEK. In exchange, AVEK will return 50 percent of the total amount delivered to AVEK, up to 5,000 af, of its future SWP water supplies to Palmdale by December 31, 2021. During 2011, a total of 2,980 af of Palmdale's Table A water was delivered to AVEK. (SWPAO #11020)

San Bernardino Valley Municipal Water District

A change in point of delivery agreement pending execution among DWR, Kern, and San Bernardino Valley Municipal Water District (San Bernardino), will provide for the delivery of up to 30,000 af of San Bernardino's 2011 Table A water to Kern for storage in the groundwater basin underlying Kern Delta Water District, a member unit of Kern, and for the return of up to 5,000 af per year of stored water to San Bernardino by December 31, 2035. During 2011, a total of 8,066 af of San Bernardino's Table A water was delivered to Kern under this agreement. (SWPAO #11015)

Santa Barbara County Flood Control and Water Conservation District

A letter agreement dated February 28, 2011, and executed May 16, 2011, among DWR, Santa Barbara County Flood Control and Water Conservation District (Santa Barbara), and Palmdale, approved the exchange of up to 7,000 af of Santa Barbara's 2010 carryover

water with Palmdale's future Table A water. To prevent the potential loss in the event that San Luis Reservoir would spill, Santa Barbara's 2010 carryover water was provided to Palmdale at O'Neill Forebay and subsequently delivered to Kern to facilitate a partial return of a previous water exchange between Palmdale and West Kern Water District (West Kern), a member unit of Kern. (SWPAO #07029, Bulletin 132-09) Palmdale will return all water to Santa Barbara by December 31, 2021. During 2011, a total of 2,548 af of Santa Barbara's Article 56(c) water was made available to Palmdale for subsequent delivery to Kern. (SWPAO #11006)

A letter agreement pending execution among DWR, Santa Barbara, and Kern, will provide for the delivery of up to 17,000 af of Santa Barbara's 2011 SWP water supplies to Kern, in exchange for the return of Kern's future approved SWP water supplies equal to two-thirds, less losses, of the total amount delivered to Kern. The return of Kern's water to Santa Barbara will be completed by December 31, 2021. During 2011, a total of 11,895 af of Santa Barbara's water was delivered to Kern. (SWPAO #11018)

A letter agreement dated November 10, 2011, and executed November 28, 2011, among DWR, Santa Barbara, and Dudley Ridge, approved the delivery of up to 3,000 af of Santa Barbara's 2011 SWP water supplies to Dudley Ridge. In exchange, Dudley Ridge will return two-thirds, less losses, of its future approved SWP water supplies to Santa Barbara. The water under this agreement will be delivered to Kern's turnouts on behalf of Dudley Ridge pursuant to a previous 2008 agreement among DWR, Dudley Ridge, and Kern, which allows delivery of Dudley Ridge's SWP supplies to the Kern Water Bank for storage (SWPAO #08050). The return of Dudley Ridge's water to Santa Barbara will be completed by December 31, 2021. During 2011, a total of 2,957 af of Santa Barbara's water was provided to Dudley Ridge, of which 2,900 af was delivered to Kern's turnouts. (SWPAO #11019)

Santa Clara Valley Water District

A letter agreement dated February 16, 2011, and executed June 13, 2011, among DWR, Santa Clara, and Kern, provides for the delivery of up to 40,000 af of Santa Clara's 2010-2011 CVP water to Kern's service area for storage in Semitropic by February 28, 2011, and the future return of a like amount of water. Reclamation will make Santa Clara's CVP water available at O'Neill Forebay for conveyance to Semitropic by DWR pursuant to Article 55 of Santa Clara's long-term water supply contract. Semitropic will return a like amount of water, less losses, to Santa Clara by December 31, 2035. No water was moved under this agreement in 2011. (SWPAO #10029)

A letter agreement dated February 17, 2011, and executed May 5, 2011, between DWR and Santa Clara, approved the delivery of up to 30,000 af of SWP water supplies to Santa Clara. In exchange, Reclamation will make an equal amount of Santa Clara's 2010 or 2011 CVP water supplies available to DWR at O'Neill Forebay. DWR will deliver the CVP water to SWP service areas south of O'Neill Forebay. DWR petitioned SWRCB for the consolidation of SWP and CVP places of use. The SWRCB issued Order WR-2010-0032-DWR approving the petition on November 5, 2010. During 2011, a total of 5,000 af of SWP water was delivered to Santa Clara. (SWPAO #10034)

A multiyear agreement executed November 22, 2011, among DWR, Santa Clara, and Kern, approves the conveyance of up to 100,000 af per year of Santa Clara's approved CVP water supplies to Kern for storage under the Semitropic Water Banking and Exchange Program through December 31, 2022. Semitropic will return a like amount of water, less losses, to Santa Clara by December 31, 2035. Reclamation will make Santa Clara's CVP water available at O'Neill Forebay for conveyance to Semitropic by DWR under Article 55 of

Santa Clara's long-term water supply contract. During 2011, a total of 36,411 af of Santa Clara's CVP water was delivered to Semitropic under this agreement. (SWPAO #11012)

Tulare Lake Basin Water Storage District

A long-term change in place of use agreement executed January 7, 2011, among DWR, Tulare Lake Basin Water Storage District (Tulare) and Westlands, approves the delivery of up to 8,000 af per year of Tulare's Table A water to Westlands' turnouts through April 1, 2027. The transfer was made on behalf of two landowners, Hansen Ranches and Newton Farms, who farm in both Tulare's and Westlands' service areas. DWR petitioned SWRCB for a temporary change in place of use. The SWRCB issued an order approving the petition on November 21, 2011. No water was delivered to Westlands in 2011. (SWPAO #10006)

A letter agreement dated March 21, 2011, and executed May 6, 2011, among DWR, Tulare, and Kern, approved the transfer of up to 10,000 af of Tulare's 2011 Table A water to Kern on behalf of JG Boswell Company, a landowner with farms in both Tulare's and Kern's service areas. This transfer allowed Boswell to augment its Kern water supply to meet crop requirements. No water was delivered to Kern under this agreement in 2011. (SWPAO #11003)

A letter agreement dated March 21, 2011, and executed May 24, 2011, among DWR, Kern, and Tulare, approved the transfer of up to 5,000 af of Tulare's 2011 Table A water to Kern. The transfer was made on behalf of Sandridge Partners Incorporated, a landowner with farms in both Tulare's and Kern's service areas. An amendment dated August 22, 2011, and executed September 27, 2011, increased the amount of Tulare's 2011 Table A water delivered to Kern to 6,000 af. During 2011, a total of 6,000 af of Tulare's Table A water was delivered to Kern. (SWPAO #11004 and SWPAO #11004-A)

A letter agreement dated March 21, 2011, and executed April 22, 2011, among DWR, Tulare, and Westlands, approved the transfer of up to 2,000 af of Tulare's 2011 Table A water to Westlands on behalf of Westlake Farms Incorporated, with farms in both Tulare's and Westlands' service areas. During 2011, a total of 500 af was delivered under this agreement. (SWPAO #11005)

A letter agreement dated April 7, 2011, and executed April 13, 2011, between DWR and Tulare, approved the transfer of up to 8,000 af of Tulare's 2011 Table A water to Westlands. The transfer was made on behalf of two landowners, Hansen Ranches and Newton Farms, with farms in both Tulare's and Westlands' service areas. The SWRCB issued Order WR 2011-0010-DWR approving the petition on April 1, 2011, for the transfer in 2011 only. For subsequent years, a long-term agreement providing for the same landowner transfer is described above (SWPAO #10006). During 2011, a total of 2,000 af of Tulare's Table A water was delivered to Westlands. (SWPAO #11008)

A letter agreement dated August 24, 2011, and executed August 25, 2011, between DWR and Tulare, approved the conveyance of up to 30,000 af of Friant Recirculation Water in association with the San Joaquin River Restoration Program to Tulare. This nonproject water was made available by Lower Tule River Irrigation District, Tulare Irrigation District, and Fresno Irrigation District to Tulare in exchange for a comparable amount of Tulare's local river supplies. Reclamation made this nonproject water available at O'Neill Forebay for DWR to convey to Tulare under Article 55 of Tulare's long-term water supply contract. In 2011, a total of 8,557 af was delivered to Tulare under this agreement. (SWPAO #11014)

Water Conveyance and Exchange Agreements Prior to 2011

Castaic Lake Water Agency

By a letter dated June 2, 1994, DWR recognized the long-term agreement, *Wheeling of SWP Water and other Allocated Water to Castaic Lake Water Agency*, between Castaic Lake and Metropolitan for the conveyance of Castaic Lake's SWP water through Metropolitan's Foothill Feeder. Metropolitan will convey Castaic Lake's water to the Rio Vista Water Treatment Plant in Castaic's service area. During 2011, DWR delivered to Metropolitan's turnout facility a total of 18,898 af of Castaic Lake's approved SWP water supplies, of which 597 af was Article 56(c) water and 18,301 af was Table A water. (SWPAO #94001)

County of Kings

A long-term change in point of delivery agreement, executed March 10, 2006, among DWR, County of Kings (Kings), and Tulare, provides for the delivery of up to 200 af of Kings' annual Table A water to Westlands' turnouts. The water was conveyed to GWF Energy, LLC, for use within Kings County's service area. During 2011, 2 af was delivered to Westlands' turnouts. (SWPAO #02031)

A long-term change in point of delivery agreement, executed March 24, 2004, among DWR, Kings, and Westlands, provides for the delivery of up to 5,000 af of Kings' annual Table A water through Westlands turnouts for use at Lemoore Naval Air Station. The agreement is effective from January 1, 2004, through December 31, 2035. During 2011, DWR delivered a total of 2,244 af to Westlands' turnouts, which included 236 af of Article 56(c) water and 2,008 af of Table A water. (SWPAO #04005)

A long-term change in point of delivery agreement executed May 6, 2008, among DWR, Kings, and Westlands, provides for Kings' approved SWP water to be conveyed

to specified Westlands' turnouts in the California Aqueduct. This agreement defines the Westlands' turnouts to be used during the term of the agreement, January 1, 2007, through December 31, 2035. Kings requested the water for use on Westlands' agricultural lands within Kings' service area. During 2011, DWR conveyed a total of 718 af to Westlands' turnouts, of which 21 af was Turn-Back Pool A water, 61 af was Turn-Back Pool B water, 314 af was Article 21 water, and 322 af was Article 56(c) water. (SWPAO #07010)

Crestline-Lake Arrowhead Water Agency

A point of delivery agreement executed April 17, 2008, among DWR, Crestline-Lake Arrowhead Water Agency (Crestline), and San Bernardino, provides for an emergency water supply totaling 7,600 af to Lake Arrowhead Community Services District effective from January 1, 2007, through December 31, 2020, or until all water has been delivered pursuant to this agreement. During 2011, Crestline received 31 af from San Bernardino under this agreement. (SWPAO #07025)

Kern County Water Agency

A long-term point of delivery agreement executed June 8, 2000, between DWR and Kern, provided approval for the delivery to Western Hills Water District (Western Hills) of a portion of Kern's annual Table A water. In exchange, Kern will take a like amount of banked local water from the Pioneer Groundwater Bank. The SWRCB approved Western Hills' service area to be included within the authorized SWP place of use on April 21, 2000. During 2011, a total of 1,112 af of Kern's Table A water was delivered to Western Hills. (SWPAO #01001)

A letter agreement dated November 15, 2010, and executed November 19, 2010, between DWR and Kern, provides approval for the conveyance of up to 50,000 af of Westlands 2010-2011 CVP water to Semitropic, a

member unit of Kern, for storage and future return of a like amount of water to Westlands by December 31, 2021. Reclamation will make Westlands' CVP water available at O'Neill Forebay for conveyance by DWR to Semitropic under Article 55 of Kern's long-term water supply contract. During 2011, a total of 3,220 af was delivered to Kern under this agreement. (SWPAO #10022)

The Metropolitan Water District of Southern California

A letter agreement dated July 20, 2010, and executed July 23, 2010, among DWR, Metropolitan, and Santa Clara, provides for the delivery of up to 37,700 af of Metropolitan's nonproject water to Santa Clara in exchange for the delivery of an equal amount of Santa Clara's approved SWP water supply to Metropolitan. This exchange facilitated the return of Metropolitan's nonproject water under the 2003 Reclamation/Metropolitan Water Exchange Agreement. Metropolitan's nonproject water was conveyed to Santa Clara by DWR under Article 55 of Santa Clara's long-term water supply contract. During 2011, a total of 9,993 af of Metropolitan's nonproject water was delivered to Santa Clara, of which 8,168 af was delivered to Santa Clara's turnout in Reach 9 of the South Bay Aqueduct, and 1,825 af was delivered to San Luis Reservoir, thereby completing this agreement. (SWPAO #10016)

A letter agreement dated November 17, 2010, and executed on November 19, 2010, among DWR, Metropolitan, Westlands, and San Luis Water District (San Luis), provided for the conveyance of up to 150,000 af of Westlands' and San Luis' water to Metropolitan under Article 55 of Metropolitan's long-term water supply contract. The water was previously stored in San Luis Reservoir. Metropolitan will return two-thirds of the total amount delivered to its service area, up to 100,000 af of its future SWP water supplies. The exchange required a change

in place of use for the SWP and CVP water rights permits. DWR and Reclamation filed a joint petition for change to consolidate the SWP and CVP places of use south of the Delta in order to facilitate several 2010 water transfers, including this exchange. The SWRCB issued Order WR-2010-0032-DWR on November 5, 2010, and amended it on June 14, 2011, approving the joint petition for change. In 2011, a total of 73,795 af of CVP water was provided by Westlands and San Luis to Metropolitan, thereby completing this agreement. (SWPAO #10027)

Mojave Water Agency

A long-term change in point of delivery agreement executed November 13, 1997, among DWR, Mojave, and AVEK, effective through December 31, 2019, allows for delivery of up to 2,250 af of Mojave's annual Table A water to AVEK. Mojave does not have conveyance facilities to provide service to a solar energy generating station located within its service area. AVEK does have conveyance capability and has agreed to provide water service on Mojave's behalf. During 2011, DWR delivered 2,184 af of Mojave's Table A water to AVEK's Fairmont Turnout in Reach 19 of the California Aqueduct. (SWPAO #97003)

Napa County Flood Control and Water Conservation District

A change in point of delivery agreement executed December 26, 2001, among DWR, Napa County Flood Control and Water Conservation District (Napa), and Solano County Water Agency (Solano), approved the delivery of up to 628 af of Napa's annual Table A water to the City of Vallejo's Water Treatment Plant in Solano's service area. This water is further conveyed to the City of American Canyon, a member agency of Napa. The agreement is effective until December 31, 2035. A total of 39 af of Napa's 2011 Table A water was delivered to Solano's turnouts. (SWPAO #00029)

A change in point of delivery agreement executed October 11, 2010, among DWR, Napa, and Solano, approves the conveyance of up to 500 af per year of the City of Vallejo's Permit Water from Solano's service area to Napa's service area under Article 55 of Napa's long-term water supply contract. The City of Vallejo, a member agency of Solano, has water rights to nonproject water originating from Cache Slough and Lindsay Slough, tributaries of the Sacramento River. This agreement provides water to the City of Vallejo through Reach 3B of the North Bay Aqueduct, located within Napa's service area. This agreement is effective through December 31, 2035. During 2011, a total of 500 af of water was conveyed under this agreement. (SWPAO #10005)

Palmdale Water District

An agreement dated April 8, 2008, and executed July 23, 2008, among DWR, Kern, West Kern (a member unit of Kern) and Palmdale, provided for the delivery of 5,000 af of Kern's 2007 Table A water to Palmdale on behalf of West Kern, effective September 1, 2007. Palmdale will return 10,000 af of its future Table A water to Kern by December 31, 2017. This exchange was necessary in order for Palmdale to acquire an additional water supply for 2007. Kern provided 4,926 af for DWR delivery during 2007. During 2011, Palmdale returned 4,452 af to Kern under this agreement. In addition, an exchange agreement among DWR, Palmdale, and Santa Barbara, described above (SWPAO #11006), provided 2,548 af to Kern as partial return under this agreement. (SWPAO #07029)

Solano County Water Agency

A settlement agreement, which includes conveyance service by Solano, was executed May 19, 2003, among DWR, Solano, and the cities of Fairfield, Vacaville, and Benicia. The agreement provides for delivery through December 31, 2035, of up to 31,620 af per year of settlement water to Solano for

delivery to the three cities to help meet their current and future municipal and industrial water needs through the North Bay Aqueduct. During 2011, a total of 2,734 af of settlement water was delivered to Solano for conveyance to the three cities. (SWPAO #03017)

Tulare Lake Basin Water Storage District

A long-term change in point of delivery agreement executed April 5, 2009, among DWR, Tulare, and Dudley Ridge, provided for the delivery of a portion of Dudley Ridge's SWP water through Tulare's turnouts, and conversely, a portion of Tulare's SWP water through Dudley Ridge's turnouts. This agreement allows SWP water supplies to be delivered to lands within Dudley Ridge's and Tulare's service areas not otherwise serviceable using their respective conveyance facilities. This agreement is effective through December 31, 2035. During 2011, a total of 3,462 af was delivered under this agreement. (SWPAO #08062)

A letter agreement dated August 5, 2010, and executed August 10, 2010, between DWR and Tulare, approved the conveyance of up to 28,225 af of Friant Recirculation Water associated with the San Joaquin River Restoration Program to Tulare under Article 55 of its long-term water supply contract. This non-SWP water was made available at O'Neill Forebay by Reclamation. In 2011, a total of 2,539 af was delivered to Tulare under this agreement. (SWPAO #10021)

Turnout Agreements

Antelope Valley-East Kern Water Agency

On March 28, 2011, DWR executed an agreement with AVEK for modification, operation, and maintenance of the 294th Street West Turnout, located at Milepost 308.05 of the California Aqueduct. The maximum design capacity of the turnout is 18 cubic feet per second (cfs).

On June 30, 2011, DWR executed an agreement with AVEK for modification, operation, and maintenance of the 305th Street West Turnout, located at Milepost 306.7 of the California Aqueduct. The maximum design capacity of the turnout is 27 cfs.

Kern County Water Agency

On December 7, 2011, DWR executed an agreement between Kern and Buena Vista Water Storage District (Buena Vista) for construction, operation, and maintenance of Buena Vista's Turnout No. 8, located at Milepost 233.8 of the California Aqueduct. The turnout will connect and deliver water to Buena Vista's West Side Canal, and has a design capacity of 300 cfs.

Activities Related to the Monterey Amendments

Storage of Water Outside SWP Contractor Service Areas

Pursuant to Article 56(c) of the Monterey Amendments, six SWP water contractors have separate agreements with DWR to convey approved water supplies outside their service areas for storage in existing and operational groundwater storage programs and for future recovery of water to use within their service areas. These types of agreements, effective or pending execution during 2010, are listed in Table 9-1. The change in point of delivery agreements include provisions for conveyance to and from storage, and recovery methods by exchange and/or pump-in to the California Aqueduct. During 2011, a total of 462,521 af was conveyed to storage, including losses, and 39,549 af was recovered from storage.

Turn-Back Water Pool Program

Pursuant to Article 56(d) of the Monterey Amendments, the Turn-Back Water Pool Program was initiated through "Notice to State Water Project Contractors, No. 11-01," dated January 21, 2011. All SWP water

contractors who have signed the Monterey Amendments were permitted to participate in the program. The program allowed SWP water contractors to offer a portion of their approved 2010 Table A water for sale in a turn-back pool for use by interested SWP water contractors. Based on Table A supply and demand, the turn-back water pool water was allocated among the purchasing contractors.

Initial offers for sales of Pool A and Pool B of the Turn-Back Water Pool Program occurred in February and March 2011, respectively, with 14,296 af purchased under Pool A, and 16,765 af purchased under Pool B. Pool A Turn-Back water sold for \$20.96 per af (50 percent of the 2011 Delta Water Rate). Pool B Turn-Back water sold for \$10.48 per af (25 percent of the 2011 Delta Water Rate). The 2011 Turn-Back Water Pool Program closed on June 1, 2011. Notices to State Water Project Contractors describing the Turn-Back Water Pool Program are available on DWR's website.

Table 9-2 lists SWP water contractors who participated in Pool A and Pool B of the 2011 Turn-Back Water Pool Program.

Article 21 Water Program

Pursuant to the Monterey Amendments, Article 21 water replaces surplus, wet weather, and Article 12(d) water. The Article 21 Water Program allows an SWP water contractor to take delivery of water over the approved and scheduled Table A amounts for the current year. Article 21 water is only available for delivery on a short-term basis as determined by DWR when water is still available after operational requirements for SWP water deliveries, water quality, and Delta requirements are met.

Guidelines for the Article 21 Water Program for 2011 are described in the December 27, 2010, "Notice to State Water Project Contractors, No. 10-13," available on

DWR’s website. During 2011, due to water conditions and storage amounts in San Luis Reservoir, Article 21 water became available to all SWP water contractors who had signed the Monterey Amendment. A total of 420,814 af of Article 21 water was delivered to 10 contractors listed in Table 9-3.

Flexible Storage Program

Pursuant to Article 54 of the Monterey Amendments, the Flexible Storage Program provides SWP water contractors participating in the repayment of the capital costs of Castaic Lake and Lake Perris the option to withdraw water in excess of approved deliveries. The program objective is to provide additional flexibility to benefit local water management activities. Participating SWP water contractors are given 5 years to replace stored water withdrawn with approved SWP or non-SWP water.

Flexible storage allows for withdrawal of up to 160,000 af at Castaic Lake and 65,000 af at Lake Perris. SWP water contractors participating in the Castaic Lake Flexible Storage Program include Metropolitan, Ventura County Watershed Protection District (Ventura), and Castaic Lake. These contractors are allowed to withdraw up to a maximum of 153,940 af, 1,377 af, and 4,683 af, respectively. Metropolitan is the only SWP water contractor allowed to withdraw water from Lake Perris, up to a maximum of 65,000 af.

Metropolitan was the only participant in the Flexible Storage Program in 2011 at Castaic Lake. At the beginning of 2011, Metropolitan owed 13 af to Castaic Lake storage and had a balance of 4,710 af in Lake Perris. During 2011, Metropolitan withdrew 27,294 af from storage in Castaic Lake, and provided 27,307 af to storage in Castaic Lake, ending 2011 with a balance of 0 af. Metropolitan withdrew 9,237 af from storage in Lake Perris, and provided 9,237 af to storage in Lake Perris, ending 2011 with a balance of 4,710 af.

Extended Carryover Program

Pursuant to Article 56 of the Monterey Amendments, SWP water contractors can elect to store SWP water outside of their service areas and carry it over to the following year for use within their service areas. Qualified contractors can request the carryover of Table A water for delivery in the following year to the extent that such deliveries do not adversely affect current or future project operations. Factors that influence how much extended carryover water can be delivered include operational constraints of project facilities, filling of SWP conservation storage facilities, flood control releases, and water quality restrictions. If storage requests exceed the available storage capacity, the amount available is allocated among the SWP water contractors requesting storage in proportion to their annual Table A water for that year. Twenty SWP water contractors took delivery of Article 56(c) in the amount of 267,683 af of approved 2010 Table A water carried over into 2011, as extended carryover.

Lower Yuba River Accord

The Lower Yuba River Accord (Yuba Accord) was announced in 2005 to settle long-standing litigation over instream flows in the Yuba River in relation to fisheries. The purpose of the Yuba Accord is to resolve instream flow issues associated with the operation of the Yuba River Development Project in a way that protects and enhances lower Yuba River fisheries and local water supply reliability. The Yuba River Development Project provides revenues for local flood control and water supply projects, water to enhance SWP and CVP water supply reliability by offsetting Delta export reductions for the protection and restoration of Sacramento-San Joaquin Delta fisheries, and improvements in statewide water supply management, including dry year water supplies for participating SWP and CVP water contractors.

The Yuba Accord is based on three sets of agreements: a water purchase agreement with DWR, including water to help offset Delta export reductions and dry year water for participating SWP and CVP water contractors; conjunctive use agreements with Yuba County Water Agency (Yuba) member units; and a fisheries agreement resolving minimum flows. The Yuba Accord provides for higher releases into the Yuba River to benefit Chinook Salmon and steelhead, transfer water to help offset Delta export reductions annually, and dry year transfer water for SWP and CVP water contractors from both surface and groundwater substitution sources.

The required agreements were executed in late 2007 and early 2008, and the SWRCB approved the Yuba Accord on March 25, 2008, setting the flow schedules for the river and authorizing accord-based water transfers through 2025. During that same period, DWR completed the execution of 22 agreements for dry year supplies for participating SWP and CVP water contractors under the accord. A total of 166,086 af was transferred to DWR and participating SWP and CVP water contractors under the accord in 2008, 180,000 af was transferred in 2009, and 141,856 af was transferred in 2010.

In 2011, excess conditions in the Delta prevented accounting of Yuba releases as transfer water for the entire summer transfer season. Yuba must repay Component 1 water in a future year that is not a dry or critical year, will not reduce Component 2 or 3 deliveries, and is agreeable in schedule to the parties. The effects of the biological opinions on allocations and transfer timing make that repayment more difficult than was envisioned when the Water Purchase Agreement was negotiated.

In April 2009, two amendments to the Yuba Accord's water purchase agreement were executed. Amendment Number 1 resolved a technical issue related to refill accounting, and Amendment Number 2 addressed pricing issues for groundwater substitution water.

Amendment Number 3 was executed on April 22, 2010, and addressed market pricing issues for groundwater substitution water. In 2011, Amendment Number 4 to the Yuba Accord's water purchase agreement was negotiated with an expected execution date in January 2012. Amendment Number 4 provides for annual negotiations of groundwater substitution water pricing, prioritizing SWP water contractors' Delta export transfer supplies, and possibly suspending certain accounting rules to permit all groundwater substitution water to be classified as Component 4 water.

Under Amendment Number 4, all accrued groundwater substitution water is payable although it may not be exported. The single exception is that DWR and Yuba Accord water contractors will not be required to pay for the portion (if any) of groundwater substitution component water that is released in accordance with the provisions of Section 5.1.8, Supplemental Flows for Groundwater Substitution Programs, of the Yuba Accord Fisheries Agreement. When New Bullards Bar Reservoir is releasing extra water due to a wet winter, Yuba may not reduce releases or accrue groundwater substitution water during the following irrigation season.

Agreements with Non-SWP Agencies

In addition to negotiating agreements with long-term SWP water contractors to provide for specified water deliveries, DWR also enters into agreements with other agencies to provide water conveyance service.

Reclamation—Joint Point of Diversion

DWR conveys CVP water, made available by Reclamation at the Delta, from Banks Pumping Plant to O'Neill Forebay under the Joint Point of Diversion authorized in SWP and CVP water rights. The Joint Point of

Diversion allows Reclamation to make up for curtailed water exports from C.W. "Bill" Jones (Jones) Pumping Plant associated with improving conditions for fish in the Delta, or, may allow replacing water exports foregone during maintenance and repair of the Jones Pumping Plant and/or CVP conveyance facilities between the Delta and O'Neill Forebay. In 2011, DWR did not deliver CVP water to Reclamation under this agreement, effective March 1, 2010, through February 29, 2012. (SWPAO #10312)

Reclamation and Byron-Bethany Irrigation District—Musco Family Olive Company

A pending agreement among DWR, Byron-Bethany Irrigation District (Byron-Bethany), and Reclamation, provides for the conveyance of up to 800 af of Byron-Bethany's CVP water to repayment Reach 2A of the California Aqueduct for use by Musco Family Olive Company. DWR delivered a total of 467 af in 2011 under this pending agreement. (SWPAO #04300)

Reclamation and Cross Valley Canal Contractors

Through eight, 3-party contracts with Reclamation and Cross Valley Canal (CVC) water contractors, DWR conveys CVP water for CVC water contractors via the California Aqueduct through the CVC turnout at Reach 12E. The following eight CVP water contractors are defined as CVC water contractors: County of Fresno (Fresno), County of Tulare (Tulare), Hills Valley Irrigation District (Hills Valley), Kern-Tulare, Lower Tule River Irrigation District (Lower Tule), Pixley Irrigation District (Pixley), Rag Gulch Water District (Rag Gulch), and the Tri-Valley Water District (Tri-Valley). Effective January 1, 2009, Rag Gulch consolidated under Kern-Tulare. DWR approved assignment of Rag Gulch's Interim Renewal Contract to Kern-Tulare on April 7, 2009.

Fresno, Tulare, Lower Tule, and Pixley executed contracts in 1975. Hills Valley, Kern-Tulare, Rag Gulch, and Tri-Valley executed contracts in 1976. All eight original contracts terminated on December 31, 1995. In 1995, amendments were executed that extended the termination dates to February 29, 1996, for all contracts. Interim Renewal (IR) contracts have been executed during the ensuing years to extend the termination dates as follows:

- March 1, 1996, through February 28, 1998 (IR 1);
- March 1, 1998, through February 29, 2000 (IR 2);
- March 1, 2000, through November 30, 2000 (IR 3);
- December 1, 2000, through February 28, 2001 (IR 4);
- March 1, 2001, through February 28, 2002 (IR 5);
- March 1, 2002, through February 28, 2003 (IR 6);
- March 1, 2003, through February 29, 2004 (IR 7);
- March 1, 2004, through February 28, 2005 (IR 8);
- March 1, 2005, through February 28, 2006 (IR 9);
- March 1, 2006, through February 28, 2007 (IR 10);
- March 1, 2007, through February 29, 2008 (IR 11);
- March 1, 2008, through February 28, 2010 (IR 12); and
- March 1, 2010, through February 29, 2012 (IR 13).

In accordance with the terms of IR 13, DWR delivered 1,000 af to Kern-Tulare during 2011.

Reclamation and Kern National Wildlife Refuge—U.S. Fish and Wildlife Service

A letter agreement sent by DWR on September 28, 2004, and accepted by Reclamation on January 24, 2005, provided for DWR to deliver up to 30,500 af of CVP water to the Kern National Wildlife Refuge during the term May 1, 2002, through May 31, 2009. By Amendment Number 2, sent by DWR on June 17, 2008, and accepted by Reclamation on August 1, 2008, the term was extended to May 31, 2012. Under the agreement, DWR would convey CVP water from the end of Reach 7 to Buena Vista's turnouts in Reaches 10A and 12E of the California Aqueduct. DWR conveyed 23,556 af of CVP water to Reach 10A and 2,305 af of CVP water to Reach 12E for Kern National Wildlife Refuge during 2011. (SWPAO #03317)

Reclamation and San Joaquin Valley National Cemetery—U.S. Department of Veterans Affairs

A letter agreement sent by DWR on November 16, 2009, accepted by the U.S. Department of Veterans Affairs on November 19, 2009, and accepted by Reclamation on March 19, 2010, provided for the conveyance of up to 850 af of CVP water to Reach 2B of the California Aqueduct for the U.S. Department of Veterans Affairs' San Joaquin Valley National Cemetery. DWR delivered a total of 259 af to the national cemetery through Reach 2B of the California Aqueduct in 2011. (SWPAO #03312)

Water Deliveries

Table A Deliveries

Each year, by October 1, the SWP water contractors submit initial requests for Table A deliveries allocated to them for use in the subsequent calendar year. Initial Table A allocation amounts for the coming year are made by DWR in December.

They are based on operations studies that assume 90 percent exceedence of historical water supply (where exceedence refers to the possibility that water supply in the coming year will be exceeded by the historical water supply), current reservoir storage, and total requests by the SWP water contractors. Forecasts for the year are updated as hydrologic conditions change. Table A amounts are increased or decreased depending on both actual and projected hydrologic conditions, though decreases are rare as the 90 percent exceedence criterion is fairly conservative.

On October 1, 2010, SWP water contractors submitted initial requests for 2011 totaling 4.17 million acre-feet (maf).

DWR approved 1.04 maf on November 22, 2010, resulting in initial Table A amounts of 25 percent of most SWP water contractor requests. DWR increased the 2011 Table A amounts to 3.34 maf, or 80 percent, on April 20, 2011. Table 9-4 lists the changes in Table A amounts that were approved by DWR based on updated hydrologic conditions.

Table 9-4 2011 Allocated Table A Amounts

Notice to SWP Contractors No.	Allocation Amount (maf)	Percentage of Requested Water
10-12	1.04	25
10-14	2.09	50
11-03	2.50	60
11-05	2.92	70
11-06	3.34	80

2011 SWP Deliveries

The SWP delivers water for a variety of beneficial uses. In addition to delivering Table A water to SWP water contractors, the SWP:

- provides water for wildlife and recreational uses;

- conveys water to other public and local agencies through special contracts and agreements; and
- stores, releases, and delivers local runoff water from SWP facilities to agencies that hold local water rights.

In 2011, 4,630,798 af of SWP and non-SWP water was delivered to 29 long-term SWP water contractors and 24 other agencies.

The portion delivered to the SWP water contractors was 3,348,931 af, categorized as follows:

- 2,512,484 af of Table A water;
- 12,331 af of transferred Table A water;
- 23,383 af of exchanged Table A water;
- 31,061 af of Pool A and Pool B water;
- 420,814 af of Article 21 water;
- 268,313 af of 2010 carryover water (Article 12(e) and Article 56(c));
- 39,549 af recovered from water banks;
- 36,531 af of flexible storage withdrawal;
- 2,872 af of settlement water; and
- 1,593 af of SWP water for recreation and fish and wildlife.

The remaining portion was delivered to 24 non-SWP agencies and totaled 1,281,867 af, which was categorized accordingly:

- 1,064,507 af of local water;
- 1,141 af of permit water; and
- 216,219 af delivered to satisfy agreements between the SWP and CVP.

Figure 9-1 shows amounts of water delivered to various locations during 2011.

Specific information about water deliveries made to SWP water contractors and other agencies during 2011, and historical

Figure 9-1 Water Delivered in 2011 and Delivery Locations of Long-term Water Supply Contractors and Feather River Area Districts with Water Rights Agreements with DWR

deliveries from 1962 through 2011, are presented in the following three sections, each with a corresponding table located at the end of the chapter:

- Water Delivered to Long-term Water Supply Contractors in 2011, by Service Area (Table 9-5);
- Total Amounts of Water Delivered in 2011, by Month (Table 9-6); and
- Total Amounts of Annual Table A Water and Water Conveyed, by Type, 1962–2011 (Table 9-7).

Please note that the water delivery figures listed are accurate at the time of this Bulletin 132 publication, but small volumes of water may be reclassified over time pursuant to long-term water supply contract provisions. If your research requires more current data than was available at the time of publication, please consult the most recent edition of Bulletin 132 and/or contact DWR staff in the State Water Project Analysis Office.

2011 Water Deliveries to Long-term SWP Water Contractors

Table 9-5 shows amounts delivered in 2011. The following information is arranged by column number.

Table A Water Delivered

Columns 1 through 5 show a detailed breakdown of Table A water delivered for SWP water contractors in 2011.

Turn-Back Pool Water

Column 4 shows 31,061 af of Turn-Back Pool Water delivered to SWP water contractors in 2011.

2010 Carryover Table A Water Delivered in 2011

Column 6 shows a total of 268,313 af was carried over from 2010 for delivery in 2011.

The carryover program was designed to encourage the most effective and beneficial use of water and to avoid obligating the contractors to use or lose water by December 31 of each year. The SWP water contractors' long-term contracts and amendments state the criteria for carrying over Table A water from one year to the next under Articles 12(e), 14(b), and 56(c).

Total Table A Water Delivered

Column 7 shows all Table A water delivered in 2011—a total of 2,847,572 af.

Article 21

Column 8 shows 420,814 af of 2011 Article 21 water was delivered to SWP water contractors.

Other SWP Water

Column 9 shows 39,403 af of other SWP water. Other SWP water includes flexible withdrawal water from Castaic Lake and Lake Perris, and settlement water.

Total SWP Water Delivered

Column 10 shows 3,307,789 af of total SWP water was delivered in 2011. This includes total Table A water, 2010 Table A carryover water, Article 21 water, and other SWP water consisting of settlement and flexible withdrawal water.

Non-SWP Water Deliveries

Columns 11 and 12 include deliveries of non-SWP water to long-term water contractors. Column 11 shows 39,549 af of water bank recovery water. Column 12 shows 205,438 af of other non-SWP water. Other non-SWP water is local and permit water that an SWP water contractor has a water right to, water purchased from, exchanged with, or transferred from non-SWP agencies. In 2011, non-SWP water deliveries totaled 1,281,867 af.

Total Deliveries

Column 13 shows total amounts of water delivered to SWP water contractors. In 2011, the SWP delivered 3,552,776 af of water to 29 long-term contractors.

Water Delivered in 2011 by Month

During 2011, the SWP provided water service to 53 agencies, including 29 long-term SWP water contractors. Those agencies and the amounts of water delivered to them by month are listed in Table 9-6 and are summarized below as SWP water and non-SWP water.

SWP Water

SWP water, as defined in the long-term water supply contracts, includes Article 21 water, carryover Table A water, current year Table A amounts, transfer and exchange of Table A water, and Turn-Back Pools A and B. Detailed information concerning those conveyances is found under the "Miscellaneous Agreements with Long-term SWP Water Contractors" section in this chapter.

Non-SWP Water

In 2011, DWR used SWP facilities to convey non-SWP water for various agencies according to the terms of water rights and water transfer and exchange agreements. Detailed information concerning those conveyances is in this chapter.

Water Rights Water. Water in this category is transported through SWP facilities to long-term SWP water contractors and other agencies according to terms of various settlement agreements. Some water passes through SWP transportation facilities; some is stored in SWP reservoirs for release later. In 2011, 1,065,648 af of water in this category was delivered to the Feather River, Delta, North Bay, South Bay, and Southern California areas, and is summarized below.

Feather River Area. Ten non-SWP agencies received 1,028,542 af; as follows:

- Last Chance Creek Water District, 7,499 af;
- Thermalito Irrigation District, 1,804 af;
- South Feather Water and Power Agency (formerly Oroville-Wyandotte Irrigation District), 3,816 af;
- Western Canal Water District, 304,564 af;
- Joint Water Districts Board, 687,449 af;
- Oswald Water District, 881 af;
- Tudor Mutual Water Company, 589 af;
- Garden Highway Mutual Water Company, 14,955 af;
- Plumas Mutual Water Company, 6,729 af; and
- Valberde and Ramelli, 256 af.

Delta. In the Delta, 20,926 af of Byron-Bethany water was delivered pursuant to the May 28, 2003, *Agreement Between the Department of Water Resources of the State of California and the Byron-Bethany Irrigation District Regarding the Diversion of Water from the Delta*.

North Bay Area. In the North Bay area, 1,141 af of Vallejo permit water and 2,734 af of water pursuant to the May 19, 2003, *Settlement Agreement among DWR, Solano County Water Agency, and the Cities of Fairfield, Vacaville, and Benicia* were delivered.

South Bay Area. In the South Bay area, a total of 9,602 af of local water was delivered to Alameda-Zone 7 and Alameda County. These two South Bay Aqueduct (SBA) SWP water contractors hold water rights to runoff from the Lake del Valle watershed.

Southern California Area. In the Southern California area, 299 af of local runoff from the Houston Creek watershed was stored and delivered to Crestline under water rights held by DWR on Houston Creek. The authorized place of use is limited to Crestline.

Annual Table A Water and Water Delivered Since 1962

Information about 2011 annual Table A water and water conveyed for the previous 49 years is contained in Table 9-7. The following discussion of conveyed Table A water is arranged according to column numbers.

Annual Table A Water

Columns 1 through 7 of Table 9-7 show the amount of SWP water contractors' annual Table A water by area for years 1962 through 2011 as specified in the Table A schedules of the long-term water supply contracts.

In some instances, Table A schedules—projections of each contractor's need for water to 2035—have been amended to meet the needs of individual contractors. The amounts of annual Table A water each SWP water contractor may request for years 1962 through 2035 can be found in Table B-4 in Appendix B in the back of this bulletin.

Water Delivered

Columns 8 through 16 show water delivered or conveyed, including initial fill water and operational losses and storage changes.

Table A Water. Column 8 shows amounts of Table A water delivered each year from 1962 through 2011. In 2011, a total of 2,847,572 af of Table A water was delivered.

Article 21 and Unscheduled Water.

Column 9 shows amounts of Article 21 water, as defined under SWP deliveries, and unscheduled water delivered from 1962 through 2011. Article 21 and unscheduled water is water in excess of that required to meet all demands for the year's Table A water and water to be stored in SWP reservoirs. In 2011, a total of 420,814 af of Article 21 water was delivered. No unscheduled water was delivered.

Other Water. Column 10 includes amounts of water classified as other water delivered in 2011, including non-SWP water conveyed through SWP facilities and regulated delivery of local supply. In 2011, a total of 332,277 af of other water was delivered.

Feather River Diversions. Column 11 includes amounts of water from the Feather River delivered according to agreements for water rights water. Column 11 also includes Delta diversions. In 2011, a total of 1,028,542 af in this category was delivered to agencies in the Feather River area.

Recreation Water. Column 12 shows water conveyed for recreational use or to provide water to improve water quality for fish and wildlife. In 2011, a total of 1,593 af of SWP water was conveyed for this purpose.

Initial Fill Water. The quantities listed in Column 14 represent the amounts used to initially fill the aqueducts and reservoirs south of the Delta to maximum operating capacities. Initial filling began in 1962, with the filling of the SBA, and was completed in 1979, when Lake Perris reached its maximum operating capacity of 127,000 af. In 1996 and 1997, the Coastal Aqueduct was initially filled.

Operational Losses. Column 15 includes the total amounts of water lost through evaporation and seepage, net storage changes in reservoirs south of the Delta, and amounts of inflow from local drainage areas, including inflows into San Luis Canal and from the Kern River Intertie. Negative values are indicated for years when withdrawals and evaporation from reservoirs south of the Delta exceed the amounts of water added to the reservoirs.

Table 9-5 Water Delivered to Long-term Contractors through 2011, by Service Area (acre-feet)^a

^a Please note that the water delivery figures listed are accurate at the time of this Bulletin 132 publication, but small volumes of water may be reclassified over time pursuant to long-term water supply contract provisions. If your research requires more current data than was available at the time of publication, please consult the most recent publication of Bulletin 132 and/or contact DWR staff in the State Water Project Analysis Office.

^a Values include amounts of deliveries to short-term contractors (Mustang Water District, 1970–1972; Tracy Golf and Country Club, 1974, 1979, and 1980; Green Valley Water District, 1974, 1975, 1978, 1979, 1980, and 1985; and Granite Construction Company, 1980).

^b Includes amounts of SWP and non-SWP water conveyed for SWP and non-SWP water contractors.

^c Includes amounts of water diverted under various water rights agreements.

^d Amounts reflect net effect of (1) operational losses from SWP transportation facilities; (2) changes in reservoir storage south of the Delta; (3) storable local inflows to SWP reservoirs; (4) side inflow to San Luis Canal; and (5) inflow into California Aqueduct from Kern River Intertie.

Chapter 10

Power Resources

Wind turbines in the Sacramento-San Joaquin Delta.

Significant Events in 2011

Power generating facilities on the West Branch and East Branch of the State Water Project (SWP) were renamed South SWP Hydropower by a Federal Energy Regulatory Commission (FERC) order amending Project No. 2426 on July 7, 2011.

Senate Bill 224, passed in 2011, exempts all Department of Water Resources' (DWR) energy-related contracts from approval by the Department of General Services. This streamlines the energy contract approval process and allows DWR more flexibility with regard to its selection of contractors under certain conditions.

Energy used at the 29 SWP pumping and generating plants totaled 8.55 million megawatt hours (MWh). To meet the energy needs of the SWP, DWR purchased 4.40 million MWh of energy at a cost of \$135 million.

DWR purchased 3.46 million MWh of short-term energy under the WSPP agreement from ten WSPP marketers and one public electric utility at a cost of \$121 million.

Pursuant to its excess power sales agreements, DWR sold 1.19 million MWh of energy to one utility and six WSPP power marketers totaling \$44 million in revenues.

Information for this chapter was provided by the State Water Project Analysis Office, the SWP Power and Risk Office, and the Hydropower License Planning and Compliance Office.

Long-term State Water Project (SWP) water contractors depend on the SWP to obtain economical sources of power in order to deliver affordable water. Consequently, the Department of Water Resources (DWR) administers a comprehensive power resources program. Key elements of the program include studies of power resources for future needs, acquisition of long-term power resources and transmission services, short-term purchases or sales of power, and the strategic operation of generation and pumping facilities.

Power Resources Program

The goals of the SWP power resources program are to:

- obtain reliable, environmentally sensitive, and competitively priced power resources and transmission services sufficient to operate the SWP;
- develop and manage power resources to minimize the cost of water deliveries to SWP water contractors;
- meet responsibilities and criteria of the Western Electricity Coordinating Council; and
- conform to regulations of the Federal Energy Regulatory Commission (FERC).

To achieve these goals, DWR constructed its own power facilities and enters into long-term contracts and short-term arrangements with other electric utilities and with the California Independent System Operator (CAISO) for transmission access and for power purchases and sales. DWR's generators and pumps also provide a mix of regulation, spinning, and nonspinning reserves to the CAISO's ancillary services market. In addition, DWR's power resources program takes advantage of SWP water storage and conveyance capacities to control pump loads and generation in a cost-effective manner.

Major Electric Utility Industry Developments

In 2011, CAISO continued to augment its new market structure—Market Redesign and Technology Upgrade (MRTU)—with new products and to fix issues with market behavior and price fluctuations.

Phase 2 of CAISO's bidding and mitigation of commitment costs initiative was implemented in April 2011. In addition to changing the gas delivery point from SoCal Border to SoCal CityGate, which allowed generators located in the fuel regions south of path 15 to take advantage of the natural gas price representative of the fuel costs, CAISO allowed generators to independently elect cost options, either proxy or registered, for start-up and minimum load costs. This allowed resource owners, including DWR, to recover their operating costs in a more efficient manner.

In May 2011, CAISO made a tariff filing with FERC to approve the Reliability Demand Response Product, a wholesale demand response product that enables compatibility with, and integration of, existing retail emergency-triggered demand response programs into the CAISO market and operations. This includes demand response resources that desire to be dispatched only under particular system conditions. This initiative reduced barriers to demand response as contemplated in FERC Order 719.

In August 2011, CAISO approved the flexible ramping constraint, an interim compensation methodology to the flexible ramping product initiative, which began in November 2011. The constraint and the product are CAISO's response to the additional burdens that increasing renewables places on ramping needs. DWR protested the proposed cost allocation and advocated that the cost allocation should better align with cost causation principles, which would result in intermittent supply that causes the additional burdens to bear the costs associated with the burdens.

CAISO continued to refine the Renewable Integration Market and Product Review (RIMPR) initiative that started in July 2010.

In November 2011, CAISO released its Draft Final Proposal for RIMPR Phase 1, which identified short-term solutions for integrating renewable resources onto the grid such as lowering the energy bid floor, allowing variable energy resources to submit decremental bids, and bid cost recovery changes. RIMPR Phase 2 began in April 2011 and focused on mid- to long-term solutions.

The development of convergence bidding was finalized in 2010, with CAISO implementation occurring on February 1, 2011. Convergence bidding was intended to increase market liquidity and provide generator participants a hedge for real-time outages. These benefits did not entirely materialize; instead, increased price divergence and higher Real Time Imbalance Energy Offset charges occurred. By the summer of 2011, CAISO's analysis indicated that market participants were paying an additional \$7.5 million per month because the two-settlement system allowed market participants to "game" the difference between Hour Ahead Scheduling Process and Real Time Dispatch prices. Following many stakeholder comments, including those by DWR, CAISO filed for a suspension of convergence bidding at the interties, which FERC granted on November 28, 2011.

Convergence bidding internal to the CAISO was left in place.

As part of a coordinated effort between utilities, developers, State agencies, and federal agencies to meet the State's policy goal of 33 percent renewable energy by 2020, the Renewable Energy Transmission Initiative (RETI) Phase 2B report was finalized in 2010, and as a result, in 2011 RETI released its updated Cost of Generation Model. Phase 2B included updates and improvements to RETI's economic models and technology assumptions in support of conceptual transmission plans for major upgrades to California's transmission system to deliver renewable energy to consumers, with a focus on identifying competitive renewable energy zones.

To meet an increase in renewable generator requests to connect to the transmission system, CAISO initiated the Generator Interconnection Procedures Phase 1 in 2010 to combine its large and small generator interconnection procedures into a single annual cluster study process. In 2011, CAISO continued to address carryover issues into Phase 2, including cost recovery for abandoned facilities, financial security posting caps, and allowable generator project size reductions.

DWR Participation in Electric Utility Industry Activities

DWR continued to participate in CAISO's stakeholder processes to help ensure that the MRTU tariff, CAISO business practice manuals, and MRTU functional simulations are compatible with operations of wholesale market participants including the SWP. DWR's participation in CAISO stakeholder processes focused on the following primary elements:

- Market Initiatives Roadmap;
- RIMPR Phase 1 and Phase 2;
- Bid Cost Recovery;

- Regulatory must-run pump load;
- Reliability Demand Response Product;
- Grid Management Charge rate structure for 2012;
- Dynamic transfer;
- Multi-stage generator enhancement;
- Load Granularity Refinements;
- Barriers to demand response;
- Real-time imbalance energy offset costs;
- Convergence Bidding;
- Participating Load refinement;
- Flexible ramping;
- Regulation energy management;
- Generator Interconnection Procedures initiatives;
- Transmission planning;
- 2012 Local Capacity procurement;
- Annual Resource Adequacy processes including the Path 26 allocation, import allocation, and net qualifying capacity;
- Interim Capacity Procurement Mechanism tariff language;
- Procurement of Calpine's Sutter Plant under the Capacity Procurement Mechanism; and
- DWR, as the Local Regulatory Authority for the SWP, updated its Resource Adequacy Program policy.

In addition, DWR participated in the California Energy Commission's planning processes by submitting a demand forecast to the California Energy Commission.

Besides CAISO and California Energy Commission stakeholder processes, DWR participated in FERC proceedings to help ensure that various market requirements or cost allocation mechanisms were appropriately structured. This included the following major processes and litigations (with FERC docket number given in parenthesis, if applicable):

- CAISO's Treatment of Participating Load within Demand Response and Order 719

- (ER11-2574, ER11-3616, ER11-4100, RM11-17-001);
- CAISO's Integration of Variable Energy Resources (RM11-10);
- CAISO's Dynamic Transfer (ER11-4161);
- CAISO's Load Granularity Refinement (ER06-615);
- CAISO's Convergence Bidding (ER11-4384, ER11-4580);
- CAISO's Bid Cost Recovery Gaming (ER11-3713, ER11-3856);
- CAISO's Flexible Ramping Constraint (EL12-50);
- Non-resource specific resource adequacy resource tariff (ER-11-4151-000);
- Non-resource specific resource adequacy resource outage reporting requirement (ER-11-4733-000);
- FERC's Electric Quarterly Report filing requirements changes (RM10-12);
- FERC's Notice of Proposed Rulemaking for Electronic Submission of Market Data (RM11-17);
- San Diego Gas & Electric Company's annual Transmission Revenue Balancing Account Adjustment and Transmission Access Charge Balancing Account Adjustment (ER11-2430);
- Southern California Edison's (SCE) ROE adder request for Whirlwind (ER11-10);
- City of Anaheim's revised annual Transmission Revenue Balancing Account Adjustment (NJ11-6);
- SCE's revised tariff for FERC's order authorizing SCE to recover 100 percent of Construction Work In Progress for four new transmission projects through its existing ratemaking mechanism (ER11-3198);
- SCE's revised Transmission Access Charge Balancing Account Adjustment (ER11-3248);
- City of Anaheim's revised base Transmission Revenue Requirement and High Voltage Transmission Revenue Requirement (ER11-3594);

- SCE's proposed Formula Rate (ER11-3697); and
- City of Riverside's revised Transmission Revenue Requirement (ER11-3984).

Bulk Electric System Reliability Standards

Background

The Energy Policy Act of 2005 assigned ownership of the Bulk Electrical System reliability to FERC and required the creation of an Electric Reliability Organization. The North American Electric Reliability Corporation (NERC) was named the Electric Reliability Organization by FERC in July 2006 and was tasked with establishing reliability standards for the Bulk Electrical System. Compliance with NERC reliability standards is mandatory.

The Western Electricity Coordinating Council is the implementation vehicle for promoting regional electric service reliability in both western Canada and the western United States. The Western Electricity Coordinating Council has oversight for implementation of these standards and validation of compliance, including assessment of penalties and/or sanctions.

Details of the NERC standards and the attributes of the compliance program appear in Bulletin 132-11.

NERC Reliability Compliance—Program Goals

DWR is committed to providing an effective reliability compliance program. In addition, DWR strives to achieve a culture of compliance that supports its key objectives of safety and reliability.

DWR established its compliance program to ensure strict compliance with NERC's mandatory reliability standards. These standards include specific impacts on operations, maintenance, physical security,

and cyber security. The compliance program performs program audits and reviews to ensure successful and ongoing compliance. Audits and reviews are done by the governance side of the compliance program and include only staff that are independent of any responsibility for meeting the reliability standards. Consultants or contractors can be used for providing the objectivity that is required.

DWR's Compliance Responsibility

DWR is currently registered with NERC for 6 of 15 functional areas. These are:

- Transmission Owner (TO);
- Load Serving Entity (LSE);
- Generation Owner (GO);
- Generation Operator (GOP);
- Purchasing and Selling Entity (PSE); and
- Resource Planner (RP).

DWR organizations responsible for the registered functional areas reside within the:

- Plant Asset Management Office;
- State Water Project Operations Control Office;
- Field Division offices;
- Operations Support Office;
- State Water Project Power and Risk Office; and
- Division of Engineering.

All management and staff in these organizations are required to support DWR's compliance efforts.

DWR has continued the work required to meet the compliance requirements of the reliability standards. The fourth self-certification was completed in January 2011, involving operations, maintenance, and engineering functions, and initial work on critical cyber assets. This process requires DWR to certify that it is currently in compliance with the requirements

of each standard or provide a violation report supported by a mitigation plan to resolve outstanding items. Violations may lead to financial penalties or reduced operating flexibility.

Operations and maintenance requirements have increased and have been aggressively pursued. The work to remain in compliance has increased in the current year and is likely to be expanded as new standards are developed. Required mitigation plans were submitted as a result of self audits. Cyber security standards (Critical Infrastructure Protection) have progressed to include technical revisions and initial administrative procedures.

All personnel were involved in preparations for the February 2012 audit to include a pre-audit process to reduce risks.

Hydropower License Planning and Compliance

Compliance with FERC license terms and conditions is an important function of SWP organizations. DWR's record of compliance is significant and is an important consideration of FERC. FERC requires strict compliance with license terms and conditions and has the authority to levy fines for noncompliance. In addition to FERC setting license requirements and requiring periodic submittals, DWR is subject to safety, security, and environmental inspections and is required to comply with all inspection findings.

Oroville Facilities Relicensing

On January 26, 2005, DWR filed an application with FERC requesting a new license for the Oroville Facilities (FERC Project No. 2100). The existing 50-year hydropower license expired January 31, 2007, and, until a new license is issued, FERC is issuing annual licenses.

FERC issued the final environmental impact statement on May 18, 2007. DWR certified the final environmental impact report on July 22, 2008, and filed it with the State Water Resources Control Board the same day. One month later, Butte and Plumas counties filed a lawsuit challenging the adequacy of the final environmental impact report.

On February 11, 2010, the Attorney General, on behalf of DWR, informed Butte and Plumas counties that DWR was seeking \$675,000 in payment for the costs of preparing the administrative record; and on July 21, 2011, the Superior Court granted DWR's request for payment.

On November 19, 2010, DWR and Pacific Gas & Electric Company (PG&E) submitted the final Habitat Expansion Plan for Central Valley salmon and steelhead to the National Marine Fisheries Service for approval. The Habitat Expansion Plan proposed actions on the Lower Yuba River to meet the Habitat Expansion Agreement (HEA) goal of providing spawning habitat sufficient to accommodate an estimated net increase of 2,000 to 3,000 spring-run Chinook Salmon in the Sacramento River Basin. On December 24, 2010, DWR filed a notice of intent to withdraw from the HEA since the December 15, 2010, water quality certification for the Oroville Facilities Relicensing included terms that were materially inconsistent with the terms of the HEA. The HEA was executed as an off-license agreement, not subject to FERC's jurisdiction. However, Condition S9 of the certification required implementation of the HEA, which would automatically be incorporated into the new FERC license. On May 10, 2011, DWR rescinded its notice of intent to withdraw from the HEA since the HEA parties agreed to amend the HEA to resolve the inconsistencies related to the water quality certification. The amended HEA was finalized and executed in counterpart with an effective date of May 9, 2011.

The following is a partial list of SWP facilities that will be subject to the new license terms and conditions:

- Oroville Dam and Lake Oroville;
- Hyatt Pumping-Generating Plant;
- Robie Thermalito Pumping-Generating Plant;
- Thermalito Diversion Dam Powerplant;
- Thermalito Diversion Dam;
- Feather River Fish Barrier Dam;
- Feather River Fish Hatchery;
- Thermalito Power Canal;
- Thermalito Forebay; and
- Thermalito Afterbay.

South SWP Hydropower

DWR operates power generating facilities on the West Branch and East Branch of the SWP. These facilities are authorized by the hydropower license issued by FERC for Project No. 2426. The project was renamed South SWP Hydropower by a FERC order amending the license on July 7, 2011.

In October 2009, FERC issued an order amending Article 52 and Exhibit S of FERC Project No. 2426. The order was issued in response to DWR's 2005 application for an amendment to revise the minimum stream flow requirements and fish stocking practices in Piru Creek below Pyramid Dam. The stream flow revisions were requested to reduce impacts to the listed arroyo toad and other special-status species. FERC's order also acknowledged the Department of Fish and Wildlife and the National Marine Fisheries Service deliberations on future fish stocking practices in Piru Creek and provided 120 days for DWR to file a plan and schedule for providing catchable Rainbow Trout. DWR filed the plan with FERC on May 27, 2010. On August 26, 2010, FERC issued an order modifying and approving DWR's arroyo toad and sensitive species monitoring plan for Piru Creek.

On October 11, 2011, DWR filed an application to amend ordering paragraph (D) and defer development of the fish stocking program until the completion of the biological opinion regarding fish stocking practices in Piru Creek.

On April 24, 2010, DWR executed Amendment No. 2 to the 1969 Memorandum of Understanding with the U.S. Forest Service regarding operation of Project No. 2426 in the Los Padres and Angeles national forests. The amendment transferred the responsibility for operation and maintenance of certain recreation sites and management of public recreation activities at the Pyramid Lake Recreation Area from the U.S. Forest Service to DWR. The amendment had an effective date of January 1, 2011, and was executed to cooperatively improve facility conditions identified in a 2007 FERC inspection. In order to keep the facilities open to the public, DWR explored numerous options for recreation management and solicited the help of public recreation agencies, such as the California Department of Parks and Recreation and Los Angeles County Department of Parks and Recreation. However, DWR was unable to reach agreement with the public agencies and ultimately contracted with a private recreation concessionaire. On January 1, 2011, Parks Management Company started its 10-year contract with DWR.

Existing SWP Power Facilities

Figure 10-1 shows the names, locations, and nameplate capacities of DWR's primary power facilities.

Hydroelectric

Economic hydroelectric generation provides the largest share of SWP power resources. The combined Hyatt Pumping-Generating Plant and Robie Thermalito Pumping-Generating Plant (Hyatt-Thermalito) generate about 2.2 billion kilowatt hours (kWh) of energy in a median water year, while the

Figure 10-1 Names, Locations, and Nameplate Capacities of Primary Power Facilities

3 megawatts (MW) from the Thermalito Diversion Dam Powerplant adds another 24 million kWh per year.

Generation at California Aqueduct recovery plants—Alamo, Devil Canyon, Gianelli, Mojave Siphon, and Warne—varies with the amount of water conveyed. These five plants generate about one-sixth of the total energy used by the SWP.

Coal

Since July 1983, under the *Participation Agreement Reid Gardner Unit No. 4* between DWR and NV Energy (NVE), DWR has received energy from Reid Gardner Powerplant, a coal-fired facility in Nevada. Reid Gardner Powerplant consists of four units. DWR owns 67.8 percent of Unit 4, and NVE owns the remainder of Unit 4, as well as all of Units 1, 2, and 3. Under this agreement, DWR receives up to 235 MW from Unit 4, subject to NVE's limited right to interrupt DWR's energy deliveries. Whenever NVE interrupts DWR's scheduled energy, DWR receives payment based on NVE's combustion turbine costs. The Reid Gardner agreement expires in July 2013.

DWR Power Planning Activities

In 2011, DWR completed a power planning study of the economic viability of a second unit at the Alamo Powerplant, which would be a qualified renewable small hydroelectric facility. The project was shown to provide substantial energy and greenhouse gas reduction benefits to DWR. Following the power planning study, DWR initiated a design study to determine whether a surge chamber would be required and to conclude the project cost estimates. A project implementation decision will be made following completion of the design and cost studies.

DWR also studied two projects, the San Luis Transmission Project and the Delta

Hub Transmission Project, that would have changed the interconnection of several SWP facilities from CAISO to the Western Area Power Authority. Connecting to the Western Area Power Authority was determined to have the potential to lower transmission costs. However, the studies concluded that reductions in transmission costs were more than offset by increases in energy and operations costs. Consequently, DWR decided not to proceed with the interconnection change.

Contractual Resource Arrangements

Through joint development, DWR obtains a significant amount of capacity and energy for SWP operations from other utilities throughout California and the Southwest. However, with the implementation of the CAISO MRTU in April 2009, and implementation of CAISO's power markets that provide access to affordable day-ahead and real-time energy, DWR is less reliant on marketers and other utilities to meet its net energy needs.

Joint Developments

In 1966, DWR entered into a contract with the Los Angeles Department of Water and Power (LADWP) for joint development of the West Branch of the California Aqueduct. LADWP constructed and operates Castaic Powerplant, which is a pumped-storage facility connected to the LADWP transmission system at the Sylmar Substation. DWR receives capacity and energy at the Sylmar Substation based on weekly water schedules through the West Branch.

Gianelli Pumping-Generating Plant is a joint-use facility of DWR and the Bureau of Reclamation. DWR's share is 222 MW, and the Bureau of Reclamation's share is 202 MW.

Long-term Purchase Agreements

In 1979, DWR entered into a contract with Kings River Conservation District to receive the output of the 165 MW hydroelectric Pine Flat Powerplant. The power plant supplies the SWP with about 400 million kWh of energy in median water years.

DWR also contracts for the energy output of five hydroelectric plants totaling 30 MW owned and operated by The Metropolitan Water District of Southern California (Metropolitan).

In May 2010, DWR entered into an agreement with the Northern California Power Agency and various public agencies to finance, construct, operate, and maintain the Lodi Energy Center—a new 280 MW natural gas combined cycle combustion turbine generation facility that the Northern California Power Agency would own and operate, and from which DWR would receive 33.5 percent of the output.

Construction of the Lodi Energy Center began in July 2010 and continued on schedule through 2011. The facility is planned to be operational in 2012.

In support of its Renewable Energy Procurement Plan, DWR issued a request for proposal in November 2010 to procure renewable resources. However, primarily due to strict bidding requirements, DWR received no qualified responses by the January 2011 due date. To remedy this problem, DWR drafted a more flexible request for proposal to be issued in early 2012. This effort was facilitated by the introduction and passage of Senate Bill 224, which exempted DWR from certain contracting requirements.

Short-term Purchase Agreements

DWR typically transacts with member utilities and energy marketers of the WSPP. In 2011, these transactions included capacity to meet the requirements of

resource adequacy, which is a planning and procurement process to ensure adequate resources. In addition to transactions under the WSPP master agreement, DWR can purchase surplus energy from Metropolitan's Colorado River Aqueduct system according to the terms of the 1988 Coordination Agreement between DWR and Metropolitan. This agreement also provides for monthly surplus firm and economy energy sales from DWR to Metropolitan and energy exchanges between DWR and Metropolitan.

Load Management

DWR operates its pumps through an extensive computerized network. This control system, coupled with the operating flexibility of DWR's pumping and generating plants provided by storage reservoirs, allows DWR to maximize pumping during off-peak periods when power costs are lower—usually at night—and maximize power generation during on-peak periods when power costs are higher. By taking advantage of this scheduling flexibility, when not restricted by operating requirements, SWP pump load and generation are optimized to reduce the net cost of power needed for SWP water deliveries.

Demand Response

DWR is the largest single supplier of demand response in the CAISO market via a Participating Load Agreement under which DWR bids SWP load to be curtailed by CAISO when the price of energy in the CAISO market reaches DWR's bid price. Due to DWR's water delivery priority, these bids are normally restricted to contingency events.

Contractual Transmission Agreements

Although able to develop or construct transmission independently, DWR depends on other sources for transmission services. CAISO, PG&E, and SCE are the primary providers of both transmission

interconnections and network transmission service for SWP's power resources and pumping loads.

Under the Comprehensive Agreement with PG&E, DWR interconnects SWP power resources and pumping loads and receives 1,300 MW of firm network transmission service over the PG&E transmission system to serve SWP pump loads and power resources in Northern and Central California. Upon implementation of CAISO's MRTU on April 1, 2009, transmission service to DWR under the Comprehensive Agreement is limited to point-to-point service. The remaining transmission service in Northern and Central California, which cannot be provided through the point-to-point service provided under the Comprehensive Agreement, is received from CAISO. Through the Comprehensive Agreement, DWR also provides a remedial action scheme to PG&E whereby certain SWP pumping and generating plants can be instantaneously curtailed under certain predefined emergency events.

In Southern California, DWR receives transmission service for SWP loads and resources through CAISO. Additionally, DWR has interconnection and wholesale distribution service agreements with SCE for service over SCE's distribution transmission system from the CAISO interchange points to SWP loads and resources.

Under the participation agreement with NVE, DWR receives 235 MW of firm transmission service over NVE's transmission system between Reid Gardner Unit 4 and the El Dorado Substation. Under the Firm Transmission Service Agreement between SCE and DWR, DWR receives 235 MW of firm transmission service over SCE's transmission system between El Dorado Substation and the Pastoria and Vincent substations.

SWP Power Operations in 2011

Tables 10-1 through 10-4 present historical information about SWP power operations for calendar year 2011, including energy consumed, generated, purchased, and sold.

Energy Consumed

In 2011, energy used at the 29 SWP pumping and generating plants totaled 8.55 million megawatt hours (MWh). According to the terms and conditions of various water conveyance contracts and exchange agreements, some water belonging to the Central Valley Project is pumped through Banks and Dos Amigos pumping plants and Gianelli Pumping-Generating Plant. The Bureau of Reclamation furnishes additional energy for this purpose.

Table 10-1 shows the amount of energy used each month at SWP pumping and power generating plants to operate the SWP in 2011, excluding transmission losses.

Energy Generated

Table 10-2 shows the amounts of energy generated at SWP facilities in 2011, as well as energy purchased for SWP operations.

Hydroelectric and Coal

The Hyatt-Thermalito power complex in Oroville generated 2.21 million MWh of energy in 2011.

Energy generated at SWP aqueduct recovery plants—Gianelli, Alamo, Devil Canyon, Mojave Siphon, and Warne—totaled 1.79 million MWh.

The SWP share of energy generated at the coal-fired Reid Gardner Unit 4 in Nevada totaled 843,137 MWh.

Table 10-1 Energy Used at Pumping Plants and Power Plants in 2011, by Month (in megawatt-hours)

Pumping Plants and Power Plants	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sept	Oct	Nov	Dec	Total
Hyatt-Thermalito Pumping-Generating Plant (station service)	39	5	16	0	1	1	0	0	0	1	204	6	273

^a Contractual Resource Arrangement.
^b Energy provided by CAISO for balancing the total SWP loads and resources.

Contractual Resource Arrangements

SWP power operations rely on contractual arrangements as well as SWP facilities. These contractual arrangements include joint development projects and energy purchases.

Joint Developments

Through the *West Branch Cooperative Development Agreement* with LADWP, DWR receives energy based on the amount of water scheduled through the West Branch. In 2011, LADWP provided 412,388 MWh for DWR's share of energy generated at Castaic Powerplant.

DWR's share of Gianelli Pumping-Generating Plant used 203,068 MWh and generated 73,651 MWh of energy.

Purchases and Costs

Table 10-3 shows amounts of energy, transmission, and other services purchased in 2011, and the costs of purchases. Amounts include contractual short-term and long-term purchases. They also include transactions of energy, transmission, capacity, and ancillary services with CAISO.

DWR purchased 4.40 million MWh of energy at a cost of \$135.19 million. Other SWP-related costs, including transmission, operation, maintenance, and CAISO charges totaled \$208.41 million. This amount includes \$4.37 million for debt service and \$4.70 million for operations and maintenance, both associated with Pine Flat Powerplant. It also includes \$2.08 million for transmission service from Reid Gardner Unit 4 to El Dorado Substation and \$57.24 million for operations, maintenance, fuel, insurance, waste removal, and property taxes at Reid Gardner Unit 4.

Long-term Purchase Agreements. According to terms of the Kings River Conservation District contract, DWR receives the total output of the 165 MW Pine Flat Powerplant.

In 2011, the power plant provided 795,487 MWh of energy to the SWP at an energy component cost of \$6.14 million.

Under the Metropolitan Small Hydro contract, DWR purchased 146,697 MWh of energy in 2011 from five small hydroelectric power plants on the Metropolitan system at a cost of \$8.36 million.

Short-term Purchase Agreements. Existing resources and long-term power and transmission contracts ensure that the SWP has enough power to meet long-term needs.

When SWP power requirements exceed resources during daily operations, short-term purchases make up the difference. In 2011, the SWP purchased 3.46 million MWh of short-term energy under the WSPP agreement from ten WSPP marketers and one public electric utility at a cost of \$120.69 million.

Contractual Sales of Excess Power

In 2011, DWR sold 1.19 million MWh of energy to one utility and seven WSPP power marketers for a total revenue of \$43.72 million. DWR also received \$84.00 million in revenues for capacity and other energy-related services, including \$81.47 million for transactions made through CAISO. See Table 10-4 for information about energy and other services sold and revenue received, including those sold to CAISO.

Forecasting Power Operations

Each year, after reviewing the SWP water contractors' water delivery requests and the construction schedule for future facilities, DWR forecasts the associated energy consumption and generation through 2035. Short-term power requirements, based on actual water supply and reservoir storage levels, are determined for the current and two ensuing years of operation. Long-term

Table 10-3 Energy, Transmission, and Related Costs in 2011

Category	Contractual Energy Purchased (MWh)	Energy Costs (in dollars)	Transmission Cost Outside CAISO (in dollars)	Other Energy-related Costs (in dollars)	Total Cost (in dollars)

^a Includes all revenue under CAISO.

operational studies for the remaining years are based on median-year water supply conditions and optimal reservoir storage levels. The forecast also includes losses in reservoirs and aqueducts, recreation water, and water to replace storage in reservoirs south of the Delta.

Actual SWP power requirements may vary significantly from the forecast amounts. Those variations are due to the amount of water available and delivered in a given year. For example, dry conditions in Northern California could result in a reduction in the amount of water available for delivery and for generation. If full deliveries could not be made, less power would be used. Power requirements could also decrease during a wet year because of the availability of local water in the San Joaquin Valley or Southern California.

Conversely, power requirements could exceed the amount originally forecast if actual water deliveries are greater than

the amounts estimated. For example, if additional pumping is needed to refill reservoirs south of the Delta after an unexpectedly dry year, more power would be used.

Chapter 11

Facilities Maintenance

Lake Perris is the southernmost reservoir of the State Water Project.

Significant Events in 2011

The Patterson Dam Modifications (raise) under Specification No. 9-16 were approved by the Division of Safety of Dams (DSOD). Construction began in March 2011. The raise was completed in April 2011, and DSOD issued a Certificate of Approval with a new maximum water surface impoundment elevation of 711 feet on April 29, 2011.

The Cedar Springs Dam Replacement of Conduits and Miscellaneous Work project was completed in September 2011. Work consisted of replacing airshaft conduits, access ladders, and miscellaneous electrical work.

Frenchman and Grizzly Valley dams were inspected by Dam Safety Branch engineers and Oroville Field Division personnel following the October 26, 2011, magnitude 4.8 earthquake near Whitehawk, California. The inspections did not reveal any damage to the facilities.

A landslide shoreline inspection of Silverwood Lake was completed.

An Independent Consulting Review Board was held for Perris Dam.

Information for this chapter was provided by the Division of Operations and Maintenance, the Division of Safety of Dams, the Division of Integrated Regional Water Management, and the State Water Project Analysis Office.

The Department of Water Resources (DWR), through the Division of Operations and Maintenance (O&M), monitors all State Water Project (SWP) facilities to ensure safety and reliability. DWR is required, by federal and State law, to contract periodically with independent consultants to review the safety of SWP dams and power facilities.

Inspecting and Maintaining Project Dams

DWR conducts several types of inspections of SWP facilities to ensure that each dam is safe for continued operation. O&M staff collect and evaluate data regarding the performance of each facility. The Division of Safety of Dams (DSOD) has several programs to ensure the safety of SWP dams. DSOD engineers inspect SWP dams annually, on a fiscal year basis, to ensure they remain safe, are performing as intended, and are not developing problems. These annual inspections also include in-depth instrumentation review of dam surveillance data. Engineers from DSOD also evaluate proposed modifications to existing dams, as well as designs for any proposed new jurisdictional dams. DSOD also oversees construction activities to ensure work is performed in accordance with the approved plans and specifications. The Federal Energy Regulatory Commission (FERC) inspects all licensed SWP facilities annually. These inspections include a review of significant events, instrumentation data, and the visual appearance of each dam, penstock, or power plant. In addition, under FERC and California Water Code requirements, consulting engineers and geologists are retained to evaluate SWP dam facilities every 5 years.

DWR contracts periodically with independent consultants to review the safety of SWP dams and power facilities, except for Pearblossom Spill Basin. Pearblossom Spill Basin Dam was originally designed to be used during misoperation at the Pearblossom Pumping Plant; the spill basin was never fully completed and has never been used.

Routine Inspections

During 2011, DSOD, along with O&M staff, inspected Antelope, Frenchman, and Grizzly Valley dams in the Upper Feather River area; Oroville, Bidwell Bar Saddle, Parish Camp Saddle, Thermalito Diversion, Thermalito Forebay, Thermalito Afterbay, and Feather River Fish Barrier dams in the Oroville Field Division; Bethany, Clifton Court Forebay, Del Valle, and Patterson dams in the Delta Field Division; and Castaic, Crafton Hills, Perris, and Pyramid dams in the Southern Field Division. Perris Dam was also inspected as part of the Director's Safety Review Board in 2011.

Cedar Springs and Devil Canyon Powerplant Second Afterbay dams, in the Southern Field Division, were inspected during calendar year 2010 and will be inspected in calendar year 2012 as a part of DSOD's fiscal year reporting cycle.

Joint-use Facility Inspection

The four dams in the San Luis Field Division (Sisk, O'Neill Forebay, Los Banos Detention, and Little Panoche Detention) are used jointly with the Bureau of Reclamation (Reclamation) and are not under DSOD jurisdiction. Every 6 years, Reclamation conducts a Comprehensive Facility Review (CFR) of the four joint-use facility dams in the San Luis Field Division. The CFR's for Los Banos and Little Panoche Detention dams occurred in February 2009. The CFR's for Sisk and O'Neill Forebay dams occurred in March 2009. Periodic Facility Reviews (PFRs) are also conducted by Reclamation every 6 years using an alternate schedule spaced between the CFR schedule. PFRs will be conducted for the joint-use facilities in 2012.

Independent Reviews

California Water Code Reviews

To comply with the California Water Code and the California Code of Regulations, DWR is required to retain a consulting board to review: (1) the adequacy of the design of any dam or reservoir DWR proposes to construct and (2) the safety of the completed construction, including the terms and conditions for the Certificate of Approval.

These provisions require DWR to retain a board of three consultants to meet at least once every 5 years to review the operational performance of DWR-owned dams and more frequently when consulting on new dams. The board of consultants independently reviews and assesses safety conditions of SWP dams.

Consultants are selected based on their knowledge of geotechnical, structural, and civil engineering, including their experience evaluating dam performance. Their independent assessments include the review of dam performance during earthquakes, evaluation of instrumentation data, inspection of each dam, and evaluation of studies performed by DWR. The consultants then prepare reports on each dam, approving dams as safe for continued operation and making recommendations. Based on these recommendations, DWR prepares action plans.

In 2011, an Independent Consulting Review Board was held for Perris Dam. The board found that Perris Dam is well operated and well maintained. The board recommended that the remedial construction under consideration by DWR to address foundation liquefaction be implemented as quickly as possible.

FERC Reviews

These reviews and the FERC Part 12D safety inspections, which may be conducted by one

or more consultants, are scheduled every 5 years. No Part 12D Boards occurred for SWP dams in 2011. As a supplement to the FERC Part 12D safety inspection, FERC's Dam Safety Performance Monitoring Program requires that a Potential Failure Mode Analysis be performed for FERC-licensed dams. The Potential Failure Mode Analysis involves document review and site visits to develop a comprehensive list of potential failure modes at each dam. From this review process, three documents are generated: the FERC Part 12D Safety Inspection report; the Potential Failure Mode Analysis report; and the Supporting Technical Information document, which summarizes the project elements and details that do not change significantly over time.

Arroyo Pasajero Program

The Arroyo Pasajero and its tributaries drain approximately 530 square miles of the Diablo Range of the coastal mountains west of the California Aqueduct in Fresno County. Its downstream juncture with the San Luis Canal segment of the California Aqueduct, between Highway 198 and Avenal Cutoff Road, poses a particularly difficult operational and maintenance problem for the SWP. Reclamation designed and constructed the San Luis Canal segment of the California Aqueduct, while DWR operates and maintains it, with all costs shared 45 percent and 55 percent, respectively.

During periods of heavy rainfall, high flows in the Arroyo Pasajero and its tributaries transport heavy sediment loads eroded from the Arroyo Pasajero watershed. Over a vast amount of time, sediment transported by arroyo floods formed a 450-square-mile alluvial fan extending from its apex at the eastern margin of Pleasant Valley (Anticline Ridge) to the San Joaquin Valley trough. The California Aqueduct traverses the arroyo's alluvial fan and forms a barrier to arroyo flood flows. Flood control facilities, designed to accommodate Arroyo Pasajero

floodwater, include the West Side Detention Basin (designed to store floodwater and sediment west of the California Aqueduct), an evacuation culvert to release floodwater east of the California Aqueduct, and drain inlets to release floodwater into the California Aqueduct.

Since the floods of 1969, when nearly all of the detention basin's planned 50-year sediment storage capacity was filled by deposition, DWR and Reclamation have worked to mitigate the effects of heavy flooding and the diminished storage capacity of the detention basin. In 1980, asbestos discovered in The Metropolitan Water District of Southern California's water supply was traced to runoff from the Arroyo Pasajero and other Diablo Range streams. This discovery, in conjunction with the high cost of removing sediment from the California Aqueduct, led DWR to adjust operating procedures to minimize runoff entering the California Aqueduct. The volume of runoff and sediment transported by the Arroyo Pasajero is roughly 400 percent greater than was originally estimated during the design of the detention basin in the mid-1960s.

DWR and DWR/Reclamation Alternative Long-term Solution

Construction to restore the storage capacity of the West Side Detention Basin started in August 2004, and many of the designed improvements were completed by the summer of 2005. These improvements restored the storage capacity to the detention basin and added control over releases of floodwater into the California Aqueduct and onto private farmland. The intended 50-year level of protection is achieved by raising levees, adding a control structure equipped with an inflatable rubber dam, installing flood gates, and acquiring flood easements. As of 2011, the basin's flood control features continued to function as expected.

One project component yet to be implemented is to armor the railroad embankment to reduce damages when it's overtopped by floodwater. DWR's agreement with the railroad expired at the end of 2009, before any progress toward armoring was made. A letter was sent to the railroad informing them that DWR believed the agreements should be renewed and the armoring project should move forward. The railroad did not respond to DWR's letter, and this component has been put on a permanent hold.

In 2009, DWR signed the certificate of acceptance for the deeds for the easements and lands acquired via litigation. The deeds were recorded, and the process to transfer the rights to Reclamation, as required by the joint-use agreement, was initiated. Part of the easement transfer process required that DWR obtain title reports that correctly show DWR's rights on the affected parcels. In 2010, DWR worked on correcting errors in the title reports and on the development of a legal description for a Consent to Common Use Agreement with Fresno County for a county-owned parcel. In 2011, the errors in the title reports were corrected and the Consent to Common Use Agreement with the county was executed. The transfer documents were completed and submitted to Reclamation for acceptance.

The West Side Detention Basin is an area of interest in the U.S. Environmental Protection Agency (EPA) Atlas Mine Area Operable Unit Record of Decision issued by the EPA in 1991. Five-year reviews of the Atlas Mine Area Operable Unit began in 2001, and have continued every 5 years since. In fall 2010, as a part of the upcoming 2011 review cycle, DWR toured the basin with representatives from the EPA and inspected all of the basin flood control features as well as soil berms, gates, locks, and signs used to deter soil disturbing activities. The EPA released its Five-Year Review Report in August 2011. The report contained various recommendations for DWR to take into consideration while operating the basin.

In September 2011, the California Department of Transportation informed DWR that it now had funding through Final Design on the Proposed Bridge Project at Lassen Avenue (State Route 269) over Arroyo Pasajero. DWR provided comments on the current Project Study Report in October 2011, which focused on flood control and the ongoing operation and maintenance needs of DWR's field division staff to properly maintain the channel.

Related Activities

Planning for a restoration project similar to the West Side Detention Basin restoration project began in 2006 for the Cantua Creek Stream Group detention basins. The project goal is to improve aqueduct flood protection and water quality.

A feasibility level study for the Cantua Creek Stream Group Improvement Project completed in April 2011, identified actions such as raising embankments, making modifications to structures, and acquiring flood easements to provide a 50-year level of protection for the California Aqueduct at the Cantua Creek Stream Group. Improving water quality in the aqueduct was a significant goal of the study, since currently, several of the existing drain inlets are not gated, and sediment-laden floodwater flows directly into the aqueduct with little detention and decanting. It is widely understood that increasing flood storage and detention of this floodwater prior to releasing it into the California Aqueduct would provide a significant benefit to water quality in the aqueduct. Later in April, a project kickoff meeting was held for DWR's Division of Engineering to begin the design phase of the selected alternative.

Repairs, Modifications, and Inspections

DWR continually monitors all SWP facilities and performs repairs, modifications, and inspections as necessary to ensure safe, reliable water delivery.

In 2011, Condition Assessment Program inspections were performed on more than 20 different reaches of the SWP for more than 214 miles of canals, pipelines, and tunnels. To aid in maintenance efforts, check structures, culverts, drain inlets, gauging stations, overchutes, water tanks, surge tanks, turn-ins, turnouts, and utility crossings along the canal were inspected and rated.

In the Oroville Field Division, features that were inspected included the Thermalito Power Canal, Richvale Canal, Western Canal, and Thermalito tailrace and their associated structures. Recreational facilities were also inspected including the Sewim Bo Trail; Lime Saddle, Spillway, Bidwell Canyon, Loafer Creek, and Enterprise area boat launches; the Oroville Dam; Bidwell Bar; and Lake Oroville Visitors Center.

In the Delta Field Division, features along 39 miles of the California Aqueduct were inspected. The Suisun Marsh Facilities that were inspected included the Suisun Marsh Salinity Control Gates, Roaring River Slough Distribution System, Morrow Island Distribution System, and the Goodyear Slough Outfall.

In the San Luis Field Division, features along 2 miles of the California Aqueduct were inspected.

In the San Joaquin Field Division, features along 69 miles of the California Aqueduct were inspected.

In the Southern Field Division, features along 102 miles of the West and East branches of the California Aqueduct were inspected, including the Santa Ana Pipeline.

Inspections are scheduled annually, biannually, or every 5 years. Future inspections will aim to identify trends in maintenance and aging of the SWP.

Outages for Maintenance and Repair of Facilities

Table 11-1 presents information, arranged chronologically, about significant scheduled and unscheduled outages at SWP pumping and power plants in 2011. The table includes information about incidents resulting in outages of 14 days or more.

Table 11-1 Outages for Maintenance and Repair of Facilities in 2011, by Month

Month	Facility	Unit	Outage Description
January	Banks Pumping Plant	3	January 12 to January 31 for discharge valve U/S seat leaking oil
	Banks Pumping Plant	4	January 1 to December 31 for unit rewind; continued from August 12, 2010
	South Bay Pumping Plant	1	January 1 to August 12 for loss of synchronization/excitation; continued from January 11, 2010
	South Bay Pumping Plant	3	January 1 to December 31 for motor removal; continued from August 25, 2010
	South Bay Pumping Plant	5	January 1 to February 16 for tripping on remote auxiliary start with 86M L/O and 50/51 B phase time over current relay action
	South Bay Pumping Plant	8	January 1 to January 24 for PT fuse problem
	Hyatt Powerplant	2	January 1 to December 31 for cover plate inspection and rotary strainer packing repair
	Hyatt Powerplant	4	January 1 to December 31 for pump mode incorrect assembly; continued from May 20, 2009
	Hyatt Powerplant	5	January 1 to March 28 for penstock outage; continued from October 21, 2010
	Hyatt Powerplant	6	January 1 to April 19 for turbine cover plate concerns; continued from November 29, 2009
	Thermalito Diversion Dam	1	January 6 to April 22 for air cooler cold water leak repair
	Robie Thermalito Pumping-Generating Plant	4	January 1 to December 31 for wear ring failure; continued from October 9, 2008
	Reid Gardner Powerplant	4	January 1 to February 5 for hydrogen manifold explosion
	Crafton Hills Pump Station	1	January 31 to March 3 for East Branch Extension Phase 1 work — Yucaipa connector
	Crafton Hills Pump Station	2	January 31 to March 3 for East Branch Extension Phase 1 work — Yucaipa connector
	Crafton Hills Pump Station	3	January 31 to March 3 for East Branch Extension Phase 1 work — Yucaipa connector
	Crafton Hills Pump Station	4	January 31 to March 3 for East Branch Extension Phase 1 work — Yucaipa connector
	Cherry Valley Pump Station	1	January 31 to April 13 for East Branch Extension Phase 1 work — Yucaipa connector
	Cherry Valley Pump Station	2	January 31 to March 29 for East Branch Extension Phase 1 work — Yucaipa connector
	Cherry Valley Pump Station	3	January 31 to March 29 for East Branch Extension Phase 1 work — Yucaipa connector

Table 11-1 Outages for Maintenance and Repair of Facilities in 2011, by Month

2 of 7

Month	Facility	Unit	Outage Description
	Devil Canyon Powerplant	1	January 3 to January 27 for annual preventive maintenance
	Greenspot Pump Station	1	January 31 to March 3 for East Branch Extension Reach 3A
	Greenspot Pump Station	2	January 31 to March 3 for East Branch Extension Reach 3A
	Greenspot Pump Station	3	January 31 to March 3 for East Branch Extension Reach 3A
	Greenspot Pump Station	4	January 31 to March 3 for East Branch Extension Reach 3A
	Greenspot Pump Station	5	January 31 to March 3 for East Branch Extension Reach 3A
	Oso Pumping Plant	3	January 1 to May 9 for motor and impeller removal; continued from December 8, 2008
	Oso Pumping Plant	5	January 1 to December 31 for motor and impeller removal; continued from December 8, 2007
	Pearblossom Pumping Plant	6	January 1 to May 12 for annual Condition Assessment Program and rotor damage repair; continued from October 19, 2009
	Pearblossom Pumping Plant	9	January 10 to February 4 for mechanical seal and discharge valve O-ring replacement
	Warne Powerplant	2	January 1 to December 31 for needle replacement; continued from December 28, 2010
	Badger Hill Pumping Plant	1	January 12 to February 9 for incomplete start sequence
	Badger Hill Pumping Plant	2	January 14 to February 11 for failure to synchronize
	Badger Hill Pumping Plant	6	January 1 to May 23 for discharge valve failure to stay closed; continued from November 18, 2010
	Buena Vista Pumping Plant	2	January 1 to November 17 for stator rewind and complete overhaul; continued from June 14, 2010
	Devil's Den Pumping Plant	1	January 1 to May 17 for discharge valve repair and bypass line install; continued from July 28, 2010
	Edmonston Pumping Plant	2	January 17 to March 4 for replacing cold water, bypass, and balance lines
	Edmonston Pumping Plant	4	January 1 to May 2 for refurbishment and pump replacement; continued from October 1, 2009
	Edmonston Pumping Plant	8	January 1 to October 10 for Hitachi pump and motor refurbishment; continued from August 9, 2010
	Las Perillas Pumping Plant	6	January 1 to May 9 for neutral over current trip
	Chrisman Pumping Plant	1	January 1 to October 3 for scroll case regROUT; continued from November 15, 2010
	Chrisman Pumping Plant	2	January 1 to December 31 for pump and motor refurbishment; continued from July 26, 2010

Table 11-1 Outages for Maintenance and Repair of Facilities in 2011, by Month

Month	Facility	Unit	Outage Description
	Chrisman Pumping Plant	8	January 30 to February 19 for repairing leaking discharge valve seat
	Chrisman Pumping Plant	9	January 30 to February 19 for repairing leaking discharge valve seat
	Teerink Pumping Plant	6	January 1 to May 7 for casing repair and discharge valve removal
	Dos Amigos Pumping Plant	5	January 1 to March 24 for Biennial Condition Assessment Program; continued from September 20, 2010
	Giannelli Pumping-Generating Plant	5	January 1 to December 31 for trunnion coming out of butterfly valve
	Giannelli Pumping-Generating Plant	6	January 1 to February 2 for removing butterfly valve
	Giannelli Pumping-Generating Plant	7	January 1 to December 31 for O-ring leaking and turbine pit flooding
	Pine Flat Powerplant	3	January 18 to February 1 for scroll case/draft tube recoat
February	Banks Pumping Plant	2	February 17 to March 7 for discharge valve failure and sequencer repair
	Cordelia Pumping Plant	2	February 17 to November 17 for breaker explosion
	Mojave Siphon Powerplant	1	February 1 to March 14 for annual Condition Assessment Program
	Badger Hill Pumping Plant	2	February 14 to June 1 for inlet valve replacement
	Chrisman Pumping Plant	3	February 6 to March 1 for replacing KYA transformer 63R relay
	Chrisman Pumping Plant	9	February 19 to May 20 for failing A-phase winding high potential testing
	Dos Amigos Pumping Plant	1	February 9 to June 8 for trip and lockout on relay operation; babbitt found in oil and replacement of bearing
March	Barker Slough Pumping Plant	9	March 31 to April 28 for disconnect failure to close
	Cordelia Pumping Plant	2	March 1 to May 2 for pump and motor refurbishment
	Cordelia Pumping Plant	1	March 24 to April 18 for Breaker 132 trip testing
	Cordelia Pumping Plant	2	March 24 to April 18 for Breaker 132 trip testing
	Cordelia Pumping Plant	3	March 24 to April 18 for Breaker 132 trip testing
	Cordelia Pumping Plant	4	March 24 to April 18 for Breaker 132 trip testing
	Cordelia Pumping Plant	1	March 13 to April 18 for concrete encasement work for State Route 12 expansion
	Cordelia Pumping Plant	3	March 13 to April 18 for concrete encasement work for State Route 12 expansion
	Cordelia Pumping Plant	4	March 13 to April 18 for concrete encasement work for State Route 12 expansion
	South Bay Pumping Plant	8	March 21 to April 5 for trip on excitation

Table 11-1 Outages for Maintenance and Repair of Facilities in 2011, by Month

4 of 7

Month	Facility	Unit	Outage Description
	Robie Thermalito Pumping-Generating Plant	1	March 17 to May 6 for noise coming from pit
	Devil Canyon Powerplant	2	March 7 to March 29 for annual Condition Assessment Program
	Oso Pumping Plant	4	March 16 to May 3 for unit 3 and 5 discharge valve work
	Oso Pumping Plant	6	March 16 to May 3 for unit 3 and 5 discharge valve work
	Pearblossom Pumping Plant	8	March 7 to March 29 for Condition Assessment Program and discharge valve repair
	Edmonston Pumping Plant	6	March 7 to May 13 for cooling water piping replacement
	Giannelli Pumping-Generating Plant	1	March 17 to August 23 headgate closed to reseal discharge valve #1
	Giannelli Pumping-Generating Plant	2	March 17 to August 23 headgate closed to reseal discharge valve #1
April	Banks Pumping Plant	11	April 28 to May 20 for failure to start due to loss of hydraulic pressure on the discharge valve
	Hyatt Powerplant	1	April 27 to June 30 for Condition Assessment Program and preventive maintenance
	Reid Gardner Powerplant	4	April 19 to May 10 for risk management
	Mojave Siphon Powerplant	2	April 4 to April 29 for annual Condition Assessment Program
	Devil's Den Pumping Plant	5	April 13 to July 14 for discharge valve failure to open
	Polonio Pass Pumping Plant	2	April 13 to May 2 for trip and lockout on relay operation and discharge valve emergency shutdown
	Polonio Pass Pumping Plant	6	April 29 to June 14 for failure to synchronize on start
	Dos Amigos Pumping Plant	3	April 6 to November 1 for exciter malfunction
May	Barker Slough Pumping Plant	1	May 1 to June 8 for failure to start
	Cordelia Pumping Plant	2	May 4 to August 2 for pump and motor refurbishment
	Hyatt Powerplant	3	May 24 to July 1 for penstock outage
	Pearblossom Pumping Plant	4	May 6 to August 26 for rotor inspection
	Pearblossom Pumping Plant	7	May 23 to June 15 for discharge valve seat repairs
	Pearblossom Pumping Plant	8	May 23 to June 15 for discharge valve seat repairs
	Pearblossom Pumping Plant	9	May 23 to June 15 for discharge valve seat repairs
	Polonio Pass Pumping Plant	4	May 31 to December 31 to inspect bearings
June	Banks Pumping Plant	1	June 6 to June 28 for trip and load test
	Barker Slough Pumping Plant	1	June 13 to July 7 for failure to start on remote auxiliary command
	Hyatt Powerplant	1	June 30 to July 21 for rotor repair

Table 11-1 Outages for Maintenance and Repair of Facilities in 2011, by Month

5 of 7

Month	Facility	Unit	Outage Description
July	Devil's Den Pumping Plant	6	June 17 to July 19 for replacing outboard pump bearing
	Barker Slough Pumping Plant	3	July 8 to August 1 for unit trip while in service for unknown reason
	Hyatt Powerplant	5	July 25 to August 31 for penstock inspection and Western Electricity Coordinating Council line trip testing
August	Hyatt Powerplant	6	July 25 to August 31 for penstock inspection and Western Electricity Coordinating Council line trip testing
	Devil's Den Pumping Plant	4	July 20 to August 3 for bearing replacement
	Robie Thermalito Pumping-Generating Plant	3	August 1 to August 17 for bearing and slip ring replacement
	Mojave Siphon Powerplant	3	August 26 to September 22 for unit and governor Condition Assessment Program
September	Giannelli Pumping-Generating Plant	8	August 24 to December 31 for scroll case headcover weld repair
	Devil Canyon Powerplant	3	September 26 to October 14 for annual Condition Assessment Program
	Pearblossom Pumping Plant	5	September 12 to October 3 for annual Condition Assessment Program
October	Polonio Pass Pumping Plant	2	September 29 to December 13 for failure to synchronize during start
	Teerink Pumping Plant	1	September 6 to December 31 for pump and motor refurbishment
	Barker Slough Pumping Plant	1	October 17 to November 8 for failure to start on remote auxiliary command
	Thermalito Diversion Dam	1	October 7 to December 29 for exciter preventive maintenance
	Devil Canyon Powerplant	3	October 25 to November 11 for coupling chamber clean out
	Devil Canyon Powerplant	4	October 24 to November 22 for coupling chamber clean out
	Pearblossom Pumping Plant	1	October 10 to December 31 for Condition Assessment Program and discharge valve and pump case refurbishment
	Pearblossom Pumping Plant	9	October 24 to November 8 for switchyard outage for work on KYA, KYB, KYC, and KYD transformer work
	Devil's Den Pumping Plant	1	October 9 to November 19 for weed abatement
	Devil's Den Pumping Plant	2	October 12 to November 19 for failure to synchronize
Edmonston Pumping Plant	4	October 31 to December 31 for coating and repair on suction elbow	
Las Perillas Pumping Plant	5	October 7 to December 31 for motor refurbishment	
Polonio Pass Pumping Plant	6	October 9 to November 27 for failure to synchronize	
Pine Flat Powerplant	1	October 31 to December 31 for 230 KV switchyard preventive maintenance	

Table 11-1 Outages for Maintenance and Repair of Facilities in 2011, by Month

6 of 7

Month	Facility	Unit	Outage Description
	Pine Flat Powerplant	2	October 31 to December 31 for 230 KV switchyard preventive maintenance
	Pine Flat Powerplant	3	October 31 to December 2 for 230 KV switchyard preventive maintenance
November	Banks Pumping Plant	9	November 3 to November 18 for trip test
	Cordelia Pumping Plant	2	November 18 to December 6 for discharge valve failure to open
	South Bay Pumping Plant	1	November 14 to December 31 for Surge Tank 2 retrofit
	South Bay Pumping Plant	2	November 14 to December 31 for Surge Tank 2 retrofit
	South Bay Pumping Plant	4	November 14 to December 31 for Surge Tank 2 retrofit
	South Bay Pumping Plant	5	November 14 to December 31 for Surge Tank 2 retrofit
	South Bay Pumping Plant	6	November 14 to December 31 for Surge Tank 2 retrofit
	South Bay Pumping Plant	7	November 14 to December 31 for Surge Tank 2 retrofit
	South Bay Pumping Plant	8	November 14 to December 31 for Surge Tank 2 retrofit
	South Bay Pumping Plant	9	November 14 to December 31 for Surge Tank 2 retrofit
	South Bay Pumping Plant	10	November 14 to December 31 for Surge Tank 2 retrofit
	South Bay Pumping Plant	11	November 14 to December 31 for Surge Tank 2 retrofit
	South Bay Pumping Plant	12	November 14 to December 31 for Surge Tank 2 retrofit
	South Bay Pumping Plant	13	November 14 to December 31 for Surge Tank 2 retrofit
	Badger Hill Pumping Plant	5	November 3 to November 18 for discharge line #2 inspection and repair
	Badger Hill Pumping Plant	6	November 3 to November 18 for discharge line #2 inspection and repair
	Bluestone Pumping Plant	1	November 6 to December 31 for annual outage discharge line
	Bluestone Pumping Plant	2	November 6 to December 31 for annual outage discharge line
	Buena Vista Pumping Plant	4	November 28 to December 31 for complete unit refurbishment
	Devil's Den Pumping Plant	5	November 2 to November 19 for failure to synchronize
	Edmonston Pumping Plant	12	November 7 to December 31 for pump and motor refurbishment
	Polonio Pass Pumping Plant	1	November 6 to November 20 for annual discharge line outage
	Polonio Pass Pumping Plant	3	November 6 to December 31 for annual discharge line outage
	Polonio Pass Pumping Plant	5	November 6 to November 20 for annual discharge line outage

Table 11-1 Outages for Maintenance and Repair of Facilities in 2011, by Month

7 of 7

Month	Facility	Unit	Outage Description
	Polonio Pass Pumping Plant	6	November 27 to December 13 for failing to synchronize on start
	Dos Amigos Pumping Plant	2	November 7 to December 2 for Condition Assessment Program
December	Banks Pumping Plant	5	December 10 to December 31 for bulkhead work
	Cordelia Pumping Plant	2	December 6 to December 31 for unknown tripping
	Hyatt Powerplant	6	December 9 to December 31 for scroll case repair and reassembly
	Pine Flat Powerplant	2	December 15 to December 31 for turbine waterway recoating
	Pine Flat Powerplant	3	December 13 to December 31 for work on 13.8 KV transformer

Chapter 12

Engineering, Construction, and Real Estate

South Bay Pumping Plant, with its recently completed Stage 3 of the pumping plant enlargement project.

Significant Events in 2011

In 2011, engineering, construction, and real estate work to enhance, expand, repair, and protect the State Water Project (SWP) and other facilities within the State continued. Significant projects included the South Bay Aqueduct (SBA) enlargement, South Bay Pumping Plant expansion, Edmonston Pumping Plant refurbishment, Hyatt Powerplant pump-turbine refurbishment, and the East Branch Extension Phase I improvements and Phase II projects.

The Delta Habitat Conservation and Conveyance Program (DHCCP) continued with studies in 2011 to assess potential habitat restoration and water conveyance options.

Information for this chapter was provided by the Division of Engineering.

Initial construction of the State Water Project (SWP) facilities began in 1957 with the relocation of the Western Pacific Railroad facilities and Highway 70 near the City of Oroville to accommodate the SWP Oroville Facilities. Oroville Dam was constructed between 1961 and 1967. Construction of the South Bay Aqueduct (SBA) facilities started in 1960, and the first SWP water was delivered through the SBA in 1965 to serve Alameda and Santa Clara counties.

In 1963, work began on the California Aqueduct, and by 1968, the SWP was delivering water to long-term contractors in the San Joaquin Valley to the foot of the Tehachapi Mountains. By 1973, with the completion of Edmonston Pumping Plant at the foot of the Tehachapi Mountains and other East Branch conveyance facilities, the SWP was delivering water to Lake Perris at the southernmost point in Riverside County.

In 1974, SWP water was delivered to Los Angeles County through the West Branch facilities. SWP water was delivered to Napa County in 1968, through the first phase facilities of the North Bay Aqueduct (NBA), and to Solano County in 1988 by the second phase facilities. The first SWP water delivery through the Coastal Branch (Phase I) was made in 1968 to Kings and Kern counties.

Prior to the completion of the initial facilities in 1973, work began on the Upper Feather River facilities to supply local water, recreation, and fish enhancement. Power plants, additional pumping units, and turbine-generators that had been deferred during the initial construction of the SWP were built to ensure water quality and fish enhancement in the Delta.

From 1974 through 2011, design and construction activities shifted to repairing concrete lining failures or potential failures of the canal system and concrete pipeline sections; replacing equipment components of existing facilities; enlarging or extending aqueduct reaches; refurbishing pump-

turbine units and adding pumps and motors to existing facilities; constructing the Devil Canyon Second Afterbay; constructing Phase II of the Coastal Branch to deliver water to San Luis Obispo and Santa Barbara counties in August 1997; extending the SWP through the East Branch Extension to the San Geronio Pass service area in San Bernardino and Riverside counties; and assessing potential habitat restoration and water conveyance options in the Delta.

Design Activities

In 2011, work to enhance, expand, repair, and protect SWP water delivery facilities continued. Engineering activities supported more efficient water deliveries within the confines of legal constraints, environmental restraints, and power availability. Significant projects included SBA enlargement, South Bay Pumping Plant expansion, and feasibility studies for the East Branch Extension Phase I improvements and Phase II projects. Table 12-1 (at the end of the chapter) provides a list of completed and ongoing design work that was undertaken in 2011.

The Department of Water Resources (DWR) Division of Engineering (DOE) continued to design projects for development into the construction phase, including awarding construction contracts. DOE staff worked with many DWR divisions and offices, as well as local, State, and federal agencies. DOE staff prepared preliminary designs and estimates; developed and administered construction contract documents and carried

out construction projects; and conducted special studies of dams, canal embankments, and other SWP facilities.

Studies, reports, and activities continued from previous reporting periods, or initiated in 2011, included the following:

- fish screens at Sherman and Twitchell islands—final design;
- Frank’s Tract Pilot Project—design;
- NBA alternate intake—study;
- SBA Aqueduct Enlargement—69 kilovolt (kV) transmission line and Banks Switchyard—design;
- East Branch Enlargement, Phase II—preliminary design and environmental documents;
- Teerink, Chrisman, and Buena Vista pumping plants—furnish and install 230 kV SF6 power circuit breakers—design;
- Edmonston, Chrisman, Teerink, and Buena Vista pumping plants—replace septic tanks, sewage piping, and pumps—design;
- Perris Dam outlet tower—study;
- Perris Dam embankment remediation—design;
- Perris Dam emergency release extension—design;
- Sutter Bypass motor control center replacement—design;
- seismic loading criteria for SWP—study;
- early implementation program review—study; and
- emergency levee repair—Cache Creek Levee Mile 3.9 and Levee Mile 4.2 left bank—design.

In 2011, DOE staff completed the following studies and activities:

- seismic analysis of Enterprise Bridge—study;
- local bridge seismic safety program—design;

- Oroville Security Project—design;
- Oroville Operations and Maintenance Subcenter, garage shop—design;
- Freeman Bike Trail realignment—design;
- North-of-the-Delta Offstream Storage Investigation, Sites Reservoir Project, water conveyance facilities—study;
- Skinner Fish Facility research lab—design;
- Sisk Dam—seismic re-evaluation—study;
- replace heating ventilation and air conditioning systems, Gianelli Pumping-Generating Plant, San Luis Field Division—design;
- furnish Edmonston Pumping Plant pump and discharge valve spare parts—design;
- Pearblossom Pumping Plant, Administration Building—design;
- Check 66 trash rake improvement project—design;
- replace conduits and miscellaneous work, Cedar Springs Dam—design;
- East Branch Extension, Phase I improvements—study;
- East Branch Extension, Phase I improvements, Crafton Hills Reservoir Enlargement—design;
- East Branch Extension, Phase II—furnish American National Standards Institute (ANSI) ball valves—design;
- East Branch Extension, Phase II—furnish ANSI butterfly valves—design;
- East Branch Extension, Phase II—furnish American Water Works Association (AWWA)-standard butterfly valves—design;
- East Branch Extension, Phase II—furnish pumps, motors, variable frequency drives, and excitation systems—design;
- East Branch Extension, Phase II—furnish switchyard equipment, Citrus Pump Station—design;
- East Branch Extension, Phase II—furnish power transformers, Citrus Pump Station—design;

- Sutter Bypass—pumping plant control systems rehabilitation—design; and
- flood control improvements—Lower Butte Creek, Sutter Bypass, Weir No. 2 rehabilitation—design.

Environmental Activities

Since the inception of the SWP, environmental issues have increased in magnitude with the enactment of numerous federal and State laws. DWR has complied with these laws by incorporating environmental requirements and conditions into the design and construction phases of projects. A specific section dealing with environmental requirements and the protection of listed species has become an integral part of contract specifications for construction contracts. Contracts are reviewed to ensure compliance with requirements outlined in environmental permits for each contract. In 2011, projects requiring continuing environmental review are described below.

Delta Habitat Conservation and Conveyance Program

In 2008, as a result of calls by the Governor and Legislature to protect the Delta, the Delta Habitat Conservation and Conveyance Program (DHCCP) was established, prompting studies to assess potential habitat restoration and water conveyance options. The DHCCP is conducting an environmental review of the Bay Delta Conservation Plan (BDCP). The lead agencies preparing the joint draft environmental impact report/ environmental impact statement for the BDCP are DWR, Reclamation, the U.S. Fish and Wildlife Service, and the National Marine Fisheries Service.

DHCCP continued to:

- analyze BDCP proposed actions and alternatives through a formal environmental impact statement (EIS)/

environmental impact report (EIR) process;

- analyze options and consider areas of concern presented by the public during the EIS/EIR process; and
- develop engineering options for habitat restoration, other stressors, and water conveyance.

The environmental component of the DHCCP includes environmental impact analysis, California Environmental Quality Act and National Environmental Policy Act document preparation, environmental surveys, mitigation, and all associated permitting requirements. Approval of the BDCP, its EIS/EIR, and associated documents is essential to obtaining required permits.

In 2011, the DHCCP accomplished the following:

- completed field activities for the 2011 overwater geotechnical investigation;
- continued conventional soil testing and special laboratory testing and preparation of the DHCCP geotechnical data report;
- organized and/or participated in multiple stakeholder meetings;
- attended meetings with the Department of Transportation (Caltrans) and U.S. Army Corps of Engineers to discuss the intake configurations and possible impacts to levees and highways; and
- established a Chief Program Management Team consisting of DWR, water contractor, and Reclamation staff to develop a management strategy for the ongoing DHCCP engineering effort, and to provide coordination between the Engineering Team and the Environmental Team.

More information can be found on the BDCP website.

Construction Activities

DOE worked on 61 construction contracts in 2011. Projects included turbine and pump replacement, pipeline repair, trash rack upgrade at fish hatcheries, and recreational and maintenance facility improvements at dam and reservoir sites. Table 12-2 (at the end of the chapter) shows the following information for construction project contracts: construction division and facility, contract title, specification number, date the contractor received the Notice to Begin Work, the expected or actual acceptance date (physical completion date is discussed in narratives below), and the actual or estimated contract cost (including change orders for added work). Resolution of contract claims may extend the actual contract closeout beyond the completion or acceptance date.

SWP—General

SWP Control System

A contract (Specification No. 08-12) to replace portions of the aging SWP SCADA (supervisory control and data acquisition) system began in May 2009. This contract will furnish and install 176 controller assemblies for the replacement of remote terminal units located throughout the SWP and will furnish 16 controller assemblies for Devil Canyon Powerplant and DWR's development lab at the Joint Operations Center. The controller assemblies will be assembled from components furnished by the contractor (programmable logic controllers, sequence-of-event recorders, fiber patch panels, modems, and other equipment). Completion is scheduled for July 2013.

Communication Cable

Work began in July 2009 (Specification No. 09-02) to monitor, test, and repair approximately 450 miles of communication cable and appurtenances along the California Aqueduct. This contract, which also includes provisions for emergency repairs, as

directed, was completed in November 2011, and acceptance is expected in August 2012.

Oroville Division

Hyatt Powerplant

Refurbishment of turbine Units 1, 3, and 5 began in February 1999 (Specification No. 98-22) and was completed in May 2004. Refurbishment included manufacture, delivery, installation, and testing of new runners, wicket gates, bushings, and other components, and sandblasting, repairing, and coating water passages. The contractor continued working on its final contract submittals, including operations and maintenance manuals, into 2011. DWR accepted the contract in September 2011.

Refurbishment of pump-turbine Units 2, 4, and 6 started in November 2001 (Specification No. 01-11). All three units were commissioned by September 2007, but preparation and delivery of the final submittals continued through April 2009. Refurbishment included manufacture, delivery, installation, and testing of new runners, wicket gates, bushings, and other components, and sandblasting, repairing, and coating water passages. DWR accepted the contract in May 2011.

Oroville Operations and Maintenance Center

A new garage shop will be constructed and site work will be performed for a temporary building under a contract (Specification No. 11-03) that began in August 2011. This work is part of the Oroville Facilities Relicensing project.

Oroville Wildlife Area

A contract to construct ponds for wetland creation in the Oroville Wildlife Area began in August 2010 (Specification No. 10-07). Work included excavation of approximately 400,000 tons of aggregate from the dredger tailings, from which gravel will be separated

and stockpiled at the Feather River Fish Hatchery for later use as spawning gravel. Work was completed in November 2011, with contract acceptance expected in March 2012. A material offset for excavated material will reduce the net payments for this work.

Warehouse, Civil Maintenance Building, and Welding Shop Building

Roof replacement for the Warehouse, Civil Maintenance Building, and Welding Shop Building began in June 2008 and was completed in September 2008 (Specification No. 08-07). Added work at the Delta Operations and Maintenance Center (North San Joaquin Division) and at the Sacramento Maintenance Yard was accepted in September 2011.

North Bay Aqueduct

Napa Turnout Reservoir

Replacement of the Napa Turnout Reservoir (Specification No. 07-01) began in April 2007, and was completed in December 2011. Acceptance is expected in January 2012. The contract included replacing the existing tank with two 5-million gallon, steel covered tanks and installing piping and appurtenances. Acceptance will be extended, likely to January 2012, due to added corrosion monitoring equipment, a test station, and additional miscellaneous work at the valve vault.

Pipeline Reach N3B

Modifications to the Reach N3B pipeline, located approximately at Stations 157+00 to 158+50, 194+00 to 197+00, and 290+00 to 291+50, began in January 2011 (Specification No. 10-21) in preparation for Caltrans' State Route 12 widening project. Work included excavation and concrete encasement of the pipeline at all three sites, along with installation of a new segment of pipeline and appurtenances at the Station 290+00 to 291+50 site. The work was completed

in July 2011 and accepted in October 2011. The costs will be reimbursed 100 percent by Caltrans.

South Bay Aqueduct

Del Valle Branch Pipeline and Surge Tank

Due to a December 22, 2009, landslide on the hillside north of the Del Valle Branch Pipeline and surge tank, emergency repairs were made. Under a change order to Specification No. 08-14, the work included replacement of 373 feet of damaged 60-inch diameter prestressed concrete cylinder pipe with steel pipe, stabilization and repair of the hillside, removal and replacement of the existing surge tank foundation and valve vault, and encasement of approximately 385 feet of the existing prestressed concrete cylinder pipe. Repairs were completed in November 2010, and contract acceptance occurred in September 2011.

SBA Enlargement and Improvement

The SBA Enlargement and Improvement projects will restore the first 16.38 miles of the SBA to the 300 cubic feet per second (cfs) design flow and increase the design capacity by up to 130 cfs. This work will enlarge the South Bay Pumping Plant to accommodate four additional 45 cfs units, construct a third discharge line, construct Dyer Reservoir, enlarge the canal, and modify associated structures. Projects are described below.

Canal Modifications. Various modifications will be performed along Dyer Canal, Livermore Canal, Alameda Canal, and Del Valle Pipeline under a contract that began in October 2010 (Specification No. 09-16). Work includes raising the canal lining, canal embankment, and operating roads; removing, modifying, installing, or constructing various structures, including overchutes, inlets, pipes, bridges, trash racks, siphons, check structures, water level measurement systems, radial gates, motors, control systems, flowmeters, and valves; and

raising/refurbishing Patterson Reservoir. Completion is expected in July 2012.

Dyer Reservoir. In late July 2009, construction began on the new 500 acre-foot (af) (425 af of active storage) Dyer Reservoir (Specification No. 09-01). Contract features include the reservoir embankment, inlet and outlet structures, installation of steel pipe, road construction, and a turnout structure. Work is expected to be completed in the fall of 2012.

Siphon and Check Structure Modifications.

Modifications to and replacements for siphon and check structures (Specification No. 08-14) began in September 2008, and completion occurred in March 2010. Work included construction of the concrete canal lining, check structures, new outlet and inlet transition structures, and operating roads; removal and reinstallation of an existing trash rack system; installation of a new turnout chamber, test stations, and cathodic protection; and removal of sediment and waste. Acceptance occurred in September 2011 after change order work was completed, which included:

- SBA, repair Santa Clara Pipeline;
- SBA, modify trash rack/rake system at Dyer-Altamont Check 2;
- SBA, repair Del Valle Branch Pipeline and surge tank;
- SBA, site work for wetlands at Dyer Reservoir; and
- NBA, emergency repair at Milepost 23.77 (Pipeline Reach N3B).

A contract (Specification No. 08-21) to fabricate 10 radial gates, radial gate hoist assemblies (with associated control systems), and electric actuators for SBA check structures began in January 2009 and was completed in June 2011. Also included in this contract are the fabrication of stop logs and stop log storage racks, one trash removal system for Dyer-Altamont Check

No. 2, and two trash removal systems for Del Valle Check No. 7.

Transmission Line and Modifications to

Banks Switchyard. Construction of a new 69 kV transmission line from South Bay Pumping Plant to Banks Pumping Plant and modifications to the Banks Switchyard began in October 2009 (Specification No. 09-06). The new transmission line will increase the South Bay Pumping Plant power supply capacity and reliability while decreasing the unit cost of power. The Banks Switchyard modifications will allow a power step-down from 230 kV to 69 kV. Project work also includes installing of DWR-furnished transformers and equipment; furnishing and installing prefabricated control buildings, 13.8 kV distribution line poles and equipment, a new substation, and switchgear and equipment; and removing and disposing of existing 13.8 kV and 5 kV power distribution lines. Completion is expected in 2013.

South Bay Pumping Plant. The following contracts for the SBA Enlargement project at South Bay Pumping Plant continued throughout 2011:

- Specification No. 04-05: furnish 45 cfs pump and motor units for Unit Nos. 10 through 13 and one spare pump and motor. Work began in November 2004 and continued throughout 2011. Completion is expected in 2012.
- Specification No. 04-20: furnish valves, actuators, and hydraulic power units. Work began in May 2005. The equipment was furnished in June 2007. Repairs to the butterfly valves were added to this contract by change order; completion is expected in 2012.
- Specification No. 05-10: furnish switchyard equipment. Work began in September 2005 and is expected to be completed in 2012. Work added by a contract change order will furnish equipment for the Banks Switchyard

expansion to accommodate the new 69 kV transmission line from Banks Pumping Plant to South Bay Pumping Plant.

- Specification No. 05-05: furnish 5 kV switchgear. Work began in October 2005 and is expected to be completed in 2012.
- Specification No. 06-04: enlarge pumping plant initial facilities. Work began in August 2006 and is expected to be completed in 2012.
- Specification No. 07-02: furnish power transformers. Work began in April 2007 and was completed in September 2008. Acceptance is expected in 2012.
- Specification No. 07-18: added work included repairs to a water system pipeline adjacent to Banks Pumping Plant. Work began in December 2007 and is expected to be completed in mid-2012.

Surge Tanks

Work to seismically retrofit Surge Tank Nos. 1 and 2 (Specification No. 11-11) began in October 2011 and is expected to be completed in July 2012. Work included modifying existing footings to add post-tensioned rock anchors, replacing steel pipe and sleeve couplings, and adding steel cladding at the existing surge tanks. Additionally, reinstallation/replacement of cross connection piping, earthwork, electrical work, application of coatings, abatement of lead-based paint, and installation of miscellaneous metalwork such as grating, ladders, cages, handrails, and hatches were performed.

North San Joaquin Division

Delta Operations and Maintenance Center

Repairs to the Delta Operations and Maintenance Center roof began in August 2010 and were completed in February 2011. This work was performed under a change order to Specification No. 08-07.

Replacement of the existing 150-kilowatt standby engine generator with a new 500-kilowatt diesel engine generator and automatic transfer switch began in September 2008 under a change order to Specification No. 06-10. The existing generator was considered undersized and unable to provide reliable operation during an outage. Installation and startup of the generator and transfer switch could not be made until portions of the 69 kV transmission line contract were completed. Completion of the added work occurred in April 2011. Acceptance occurred in September 2011.

San Luis Division

Dos Amigos Pumping Plant

A contract (Specification No. 08-06) to design, manufacture, deliver, install, and test one complete automatic trash rake system and to manufacture, deliver, and install trash racks began in January 2009 and is expected to be completed in early 2012.

Gianelli Pumping-Generating Plant

Heating, ventilation, and air conditioning systems will be replaced under a contract (Specification No. 10-22) that began in April 2011. Completion is expected in June 2012.

Gianelli Pumping-Generating Plant, Dos Amigos Pumping Plant, Coalinga Operations and Maintenance Subcenter, Check Sites 9 through 21, and Flowmeters at Check Sites 12 and 21

A contract (Specification No. 06-10) to replace standby engine generators began in August 2006. The original work was completed in October 2009; the added change order work listed below was completed in July 2011. Acceptance occurred in September 2011. Added work included:

- furnishing and installing engine generators for the Delta Operations and

Maintenance Center, Banks Pumping Plant, the Feather River Fish Hatchery, and the Skinner Fish Facility;

- furnishing and installing a backup generator for University of California, Davis; and
- furnishing and installing an electrical panel at the Dos Amigos siphon house.

San Luis Canal

Due to subsidence that caused buckling and cracking in the canal lining, a contract to remove and replace damaged portions of the concrete lining along the California Aqueduct between Mileposts 56.40 and 164.90 began in November 2007 (Specification No. 07-20). Completion and acceptance is expected in November 2012. Added work includes:

- construction of a stability berm at Milepost 88.30;
- a dive survey and repairs at California Aqueduct Mileposts 89.02 and 138.96;
- Coastal Branch repairs (see Coastal Branch Reach 31A and Devil's Den Forebay sections in this chapter);
- Coastal Branch repairs between Mileposts 1.16 and 4.27; and
- repair of irrigation crossings at Mileposts 113.02R and 113.44L.

Two damaged steel irrigation pipes that cross the California Aqueduct at Mileposts 113.02 and 113.44 will be replaced by one high-density polyethylene pipe at Milepost 113.02 under a contract that began in September 2011 (Specification No. 11-09). Work includes directional drilling, repairs to the canal liner at the existing undercrossings, grouting, and abandonment of the existing pipes. Completion is expected in June 2012.

Tehachapi Division

Edmonston Pumping Plant

A contract to replace pump Units W2, W4, W6, and W8 (Specification No. 02-10) began in June 2003 and continued throughout 2011.

Completion is scheduled for March 2012, and acceptance is expected in May 2012. Work consisted of:

- designing, fabricating, and testing a four-stage pump model and a single-stage pump model, and furnishing a pump model test program report;
- designing, manufacturing, delivering, storing, and installing four pumps to replace existing pumps;
- furnishing spare parts, auxiliary equipment, tools, and templates;
- modifying existing pump foundations, if required, for the new pumps;
- applying coatings; and
- providing liaison services.

Under a contract (Specification No. 11-02) that began in June 2011, the contractor will furnish and deliver spare parts for the seven Baldwin-Lima-Hamilton pumps and discharge valves at Edmonston Pumping Plant. Spare parts include labyrinth seals, shaft seals, casing and impeller wear rings, shaft sleeves, wear plates, valve seal rings and pistons, and patch bolts. Work is expected to be completed in February 2013, and acceptance is expected in June 2013.

Mojave Division

Reaches 18A and 22B

Work began in July 2010 to seal and pave roads and parking areas in the Southern Field Division (Specification No. 10-03). Completion is expected in 2013. Added work included:

- sealing and paving roads on the California Aqueduct, West Branch, Reach 29G (Los Alamos Campground Access Road, Gorman Creek Siphon, Pyramid Lake Road, and Vaquero Campground parking lot) and
- asbestos abatement and/or testing at Buena Vista, Chrisman, and Teerink pumping plants.

Reach 20B

A minor contract (Specification No. 10-15) to repair the canal culvert at Milepost 344.38 began in August 2010 and was completed in November 2010. DWR accepted the contract in February 2011.

Cedar Springs Dam

A contract to replace conduits and perform miscellaneous work at Cedar Springs Dam began in March 2011 (Specification No. 10-06). Completion is expected in 2012.

Pearblossom Pumping Plant

A contract to construct a new 20,000 square-foot Pearblossom Administration Building near Pearblossom Pumping Plant began in February 2011 (Specification No. 10-23). The new building, which was designed and will be operated to attain the Leadership in Energy and Environmental Design gold rating, will be occupied by Southern Field Division staff and Lancaster Project Headquarters personnel. Completion is expected in July 2012.

Santa Ana Division

East Branch Extension Phase I

Construction of the East Branch Extension Phase I began with the issuance of a Notice to Begin Work on February 26, 1999, for pipeline Reaches 1 and 2. Phase I of the project is being constructed to convey 8,650 af of SWP water annually to the San Gorgonio Pass Water Agency service area, with provisions to provide San Bernardino Valley Municipal Water District deliveries to Yucaipa Valley. Located in San Bernardino and Riverside counties, the project facilities will consist of existing pipelines, three new pipeline reaches, three new pump stations, and a new reservoir. The official groundbreaking ceremony took place in Yucaipa on August 23, 1999.

Below are brief descriptions of the remaining construction contracts.

Greenspot, Crafton Hills, and Cherry Valley Pump Stations.

Work began in November 1999 on the contract (Specification No. 99-17) to design, manufacture, shop test, and deliver three 4,500 gallon per minute (gpm) and one 9,000 gpm vertical turbine pumps for Greenspot Pump Station; two 4,500 gpm and one 9,000 gpm vertical turbine pumps for Crafton Hills Pump Station; and two 3,600 gpm vertical turbine pumps for Cherry Valley Pump Station. The contract calls for electric motors, variable frequency drives, appurtenant equipment, and associated training programs. Completion of this contract was scheduled for December 2003 but was extended to March 2006 due to a change order for additional pump units and related components for Greenspot and Crafton Hills pump stations. Contract acceptance occurred in April 2011.

Work on a contract (Specification No. 06-21) to install spare units at Greenspot, Crafton Hills, and Cherry Valley pump stations, and to replace the existing control valves and unit discharge isolation valves for Greenspot Pump Station Unit Nos. 1 through 4 began in October 2006. Work was completed in April 2011 and accepted in December 2011. The work included:

- furnishing and installing a pump, motor, variable frequency drive, programmable logic controller cubicle, and motor control center unit breaker assembly at Cherry Valley Pump Station;
- furnishing and installing switchgear at Greenspot and Crafton Hills pump stations;
- installing programmable logic controllers, valves, piping, tubing, fittings, hangers, supports, and appurtenances at all three pump stations;
- installing DWR-furnished pumps and motors at Greenspot and Crafton Hills pump stations;

- installing a DWR-furnished variable frequency drive at Greenspot Pump Station;
- removing existing valves, piping, and appurtenances; and
- manufacturing and delivering tools and spare parts to all three pump stations.

Added work included modifying the switchgear to allow front access to the 5 kV bus and providing a flowmeter for Devil Canyon Second Afterbay.

East Branch Extension Phase I Improvements

The Phase I improvements will provide additional operational flexibility, system reliability, and will reduce on-peak energy demands.

Yucaipa Connector Pipeline. Fabrication and testing of 42-inch and 48-inch American Water Works Association (AWWA)-standard butterfly valves for the Yucaipa Connector Pipeline was performed under a contract (Specification No. 09-04) that began in August 2009. Completion occurred in June 2010, and acceptance occurred in August 2011.

Construction of the Yucaipa Connector Pipeline began in October 2010 (Specification No. 10-12) and is expected to be completed in 2012. The approximately one-half mile of 42-inch diameter steel pipe will allow continued deliveries of water via the East Branch Extension during enlargement of the Crafton Hills Reservoir and during future Crafton Hills Reservoir outages.

Crafton Hills Reservoir Enlargement.

A construction contract (Specification No. 11-12) to increase the reservoir's operating storage from 85 af to approximately 225 af began in December 2011 and is expected to be completed in May 2013. The work includes an earthen embankment dam with rock

slope protection, access roads, grouting, a seepage collection system, geotechnical instrumentation, and mechanical aerators.

East Branch Extension Phase II

Phase II of the East Branch Extension will complete the planned capacity increase for the East Branch Extension. Phase II will allow San Geronio Pass Water Agency to receive its maximum annual Table A water and allow the San Bernardino Valley Municipal Water District to increase its distribution system capacity to its Redlands and Yucaipa Valley service areas. Principal Phase II features include approximately 6 miles of new 72-inch and 66-inch diameter pipe, a new reservoir (Citrus Reservoir), a new 160 cfs pump station (Citrus Pump Station), expansion of the existing Crafton Hills Pump Station, and installation of an additional pump at Cherry Valley Pump Station.

Valves. Manufacturing, testing, and delivery of three energy dissipating valve assemblies (including electric actuators) for Citrus Reservoir began in September 2010 (Specification No. 10-10) and is expected to be completed in March 2013. Spare parts and special tools are included in the contract work.

Manufacturing, testing, and delivery of fourteen ANSI (American National Standards Institute) butterfly valve assemblies with actuators for Citrus Pump Station, Crafton Hills Pump Station, and Cherry Valley Pump Station began in January 2011 (Specification No. 10-16) and is expected to be completed in mid-2013. Spare parts and special tools are included in the contract work.

Manufacturing, testing, and delivery of twelve AWWA butterfly valve assemblies with actuators for Crafton Hills Pump Station, Cherry Valley Pump Station, and Mentone Pipeline began in February 2011 (Specification No. 10-17) and is expected

to be completed in mid-2013. Spare parts and special tools are included in the contract work.

Manufacturing, testing, and delivery of 12 ANSI ball valve assemblies with actuators and 4 actuators for Citrus Pump Station, Crafton Hills Pump Station, and Cherry Valley Pump Station began in January 2011 (Specification No. 10-18) and is expected to be completed in July 2013. Spare parts and special tools are included in the contract work.

Transformers. Transformers, accessories, tools, and spare parts will be manufactured, tested, and delivered for Citrus Pump Station under a contract (Specification No. 10-20) that began in March 2011. The work is expected to be completed in August 2013.

Santa Ana Pipeline

Thirteen sections (Nos. 1859–1871) of the 108-inch inside diameter Santa Ana Pipeline will be repaired under a contract (Specification No. 11-07) to install a 102-inch outside diameter steel liner inside the existing pipeline. The sections are located under Burlington Northern Santa Fe railroad tracks in the city of Colton. The upper half of one additional section (No. 1858) will be removed to provide a launching cradle for the steel liner. After installation of the liner, Section No. 1858 will be removed and replaced with a steel section. Repairs began in August 2011 and are expected to be completed in January 2012.

West Branch

West Branch (Reach 29G) General

Under a change order to Specification No. 10-03, the following work began in July 2011 and is expected to be completed in April 2012:

- Los Alamos Campground Road: paving, striping, signage, shoulder repair, and drainage improvements;

- Gorman Creek Siphon: embankment erosion repair along the shoulder of Pyramid Lake Road; and
- Vaquero Parking Lot: parking lot refurbishment.

Oso Pumping Plant

Work began in December 2007 to construct a 14,400 square-foot civil maintenance and mobile equipment building at Oso Pumping Plant (Specification No. 07-22). Work is expected to be completed in 2012; however, required added work, including a water treatment facility, may delay occupancy until 2013.

Coastal Branch

Coastal Aqueduct Under State Route 46

Three sections of existing 57-inch inside diameter steel pipe along the Coastal Aqueduct (Reach 1) under State Route 46 were encased in concrete to allow Caltrans to widen the highway (Specification No. 10-01). Caltrans funded this work, which began in April 2010 and was completed in November 2010. DWR accepted the work in December 2011.

Construction Activities in Multiple Divisions

Delta Facilities, Suisun Marsh Facilities, and California Aqueduct

Work on a multiyear (2010 through 2012) contract to install and remove seasonal temporary rock barriers in designated South Delta waterways, provide temporary agricultural pumping facilities, place and remove flashboards at the Suisun Marsh Salinity Control Structure, dredge areas of the South Delta, and remove aquatic weeds in Clifton Court Forebay and other Delta waterways began in March 2010 (Specification No. 09-21) and is expected to be completed and accepted in December 2012. The temporary barriers are installed to enhance water levels

and circulation in the South Delta for local agricultural diversion, to assist fish migration, and to gather hydraulic data for the design of future permanent barriers. Added work includes:

- Delta Facilities: installation of a nonphysical barrier at Georgiana Slough;
- Delta Facilities: modifications to the fish release facility at Curtis Landing;
- Delta Facilities: removal of trees at Horseshoe Bend;
- Suisun Marsh Facilities: urgent repairs to the Roaring River Slough levee;
- North San Joaquin Division: repair cracks in the embankment of the California Aqueduct, vicinity of Milepost 88.96; and
- South San Joaquin Division: repair boil in the California Aqueduct, vicinity of Milepost 248.97, Reach 13B.

Banks Pumping Plant and Teerink Pumping Plant

A contract to furnish spare coils and materials for Banks and Teerink pumping plants (North San Joaquin and South San Joaquin divisions, respectively) began in February 2007 (Specification No. 06-27). The contract will be extended to furnish one set of spare coils for a 30,000 horsepower motor at Pearblossom Pumping Plant (Mojave Division). Completion is expected in August 2012.

San Luis and San Joaquin Field Divisions

Work began in August 2010 on a contract to seal and pave roads and parking areas at various locations in the San Luis and San Joaquin field divisions (Specification No. 10-02). Completion occurred in November 2010, and acceptance occurred in January 2011.

Buena Vista Pumping Plant and Chrisman Pumping Plant

Roofing repairs at Buena Vista and Chrisman pumping plants (South San Joaquin

Division) and at Warne Powerplant (West Branch) (Specification No. 10-19) began in October 2010 and are scheduled to be completed in 2012.

Miscellaneous Construction Activities

The following non-SWP construction activities are categorized as miscellaneous.

Emergency Levee Erosion Repairs

San Joaquin River Mile 71.5R. Due to vertical erosion of the river bank in the vicinity of River Mile 71.5R, DWR issued an emergency contract to place rock slope protection as necessary (Specification No. 11-01). Work began and was completed in January 2011, and acceptance followed in May 2011.

Erosion Repair and Bank Protection

Work began in October 2009 to repair levee erosion and protect the river banks along the San Joaquin River at River Miles 41.4L, 42.1R, 42.5R, and 42.8R (Specification No. 09-18). Work includes fencing; removal of trees, brush, debris, and a 6-inch pipe from the levee; protection of native trees; levee repairs and rock slope protection; installation of erosion control fabric; and planting, seeding, irrigation, and plant establishment. The contract was completed in July 2011 and accepted in September 2011.

Work began in September 2011 (Specification No. 11-06) to repair erosion along the San Joaquin River (River Mile 71.5R). The work includes fencing; protection of native trees; removal of trees, brush, and debris; earthwork; rock slope protection; installation of erosion control fabric; asphalt, concrete, and pavement repairs; planting, seeding, and irrigation; in-stream woody materials; and plant establishment. Completion is expected in November 2012.

Levee Road Repairs

Levee crown repairs at the San Joaquin River, Mariposa Bypass, and Eastside Bypass began and were completed in July 2011 (Specification No. 11-08). Contract acceptance occurred in September 2011.

Habitat Restoration

A contract to restore habitat (Specification No. 08-13) at the Colusa Sacramento River State Recreation Area began in October 2008 and is expected to be completed in 2012. This work to mitigate the Tisdale Bypass sediment removal project (Specification No. 07-14 [see Bulletin 132-09]) includes planting approximately 34,000 oak trees and other plants, as well as irrigation.

In October 2010, work began on a contract (Specification No. 10-14) to restore the Sycamore Creek habitat as a condition of the nationwide permit for the Sycamore Creek sediment removal project (Specification No. 10-13). The work, which is expected to be completed in July 2014, includes seeding, plantings, an irrigation system, signage, and monitoring of vegetation until the plants are established.

A contract (Specification No. 11-05) to restore habitat and public access at Jensen River Ranch (Phase III) began in September 2011 and is expected to be completed in March 2012. This phase of the work includes new decomposed granite pedestrian and horse trails, paving of an existing trail designed to accommodate users with limited mobility, wetland creation, new fencing and gates, a new irrigation system, and new corrugated metal pipe culverts to improve drainage.

Pumping Plant Control System Rehabilitation

Replacement of the motor control centers and the control systems at Sutter Bypass Pumping Plants Nos. 1 through 3 will be

performed under a contract that began in December 2010 (Specification No. 10-09). The contractor will remove and dispose of the existing control structures and will furnish and install new control structures, switchgear, nonsegregated busses, relays, SCADA systems, ground grids, and generators. Completion is expected in 2013.

Replacements

A contract (Specification No. 10-05) to replace the existing fish ladder structure and flow control structures at Willow Slough, Sutter Bypass, began in June 2010 and is expected to be completed in late 2012.

A project to replace Weir No. 2 in the East Borrow Canal in the Sutter Bypass began in April 2011 (Specification No. 10-08). The work includes a new weir structure and fish ladder approximately 100 feet downstream from the existing weir and a control building on the levee. Completion is expected in November 2013.

Sediment Removal

Work began in September 2010 to remove approximately 63,000 cubic yards of sediment from Sycamore Creek, Chico Creek, Mud Creek, and Sandy Gulch (Specification No. 10-13). The work was completed in November 2010 and was accepted in February 2011.

Real Estate Branch Activities

DWR processed a net total of \$3.8 million in payments in 2011 in support of right-of-way activities required for the construction, operation, and maintenance of the SWP. This amount represents direct payments made for the cost of real property rights, damages, temporary permits, licenses, leases, and relocation expenses.

DWR conducted the following real estate activities from January 1 through December 31, 2011.

SWP Acquisitions

Significant activities related to acquisitions were as follows:

- received authorization from the California Public Utilities Commission to construct a new grade-separated railroad undercrossing for the Brad B. Freeman Bike Trail in Oroville;
- processed a reimbursement payment to Conoco Phillips for \$120,660.70 for costs incurred through December 31, 2008, for the California Aqueduct Milepost 62 pipeline relocation project in Merced County;
- executed four weather station monitoring agreements on behalf of the Office of Water Use Efficiency, California Irrigation Management Information System program in Monterey, Orange, and Santa Barbara counties;
- met with Fresno County Department of Public Works and Planning staff to discuss project impacts to county roads for the Cantua Creek Stream Group Improvements project;
- executed a temporary construction agreement, processed a lost profits and severance damages agreement, and recorded a quitclaim deed and easement deed to correct discrepancies in road access rights for the Del Valle Pipeline Repair project;
- closed escrow on seven parcels for East Branch Extension, Phase I improvements project;
- filed condemnation deposit with State Treasurer for condemnation suit against Mentone Citrus for Parcel No. EBX-7 and closed escrow on six parcels as part of the East Branch Extension, Phase II project;
- executed a right-of-entry permit with San Bernardino Valley Water Conservation District for construction activities for Parcel Nos. EBX-4 and EBX-8 as part of the East Branch Extension, Phase II project;
- coordinated the relocation of three dwellings in the acquisition area of Parcel No. EBX-7 in conjunction with San Bernardino Valley Municipal Water District and its consultant, Overland, Pacific & Cutler, Inc., as part of the East Branch Extension, Phase II project;
- processed owner-initiated appraisal reimbursement agreements with San Bernardino County Flood Control District as part of the East Branch Extension, Phase II project;
- secured consent for five utility crossings of the Mentone Pipeline with Southern California Gas Company as part of the East Branch Extension, Phase II project;
- coordinated and attended biological and cultural resources site reviews on 110 Assessor's Parcel Numbers in Solano and Yolo counties for the NBA Alternate Intake Project;
- obtained a temporary occupancy permit from Burlington Northern Santa Fe Railway Company and certified right of way for Santa Ana Pipeline repairs;
- secured approval for construction access with San Bernardino County Flood Control District and the City of Colton for the Santa Ana Pipeline repairs;
- conducted a public outreach meeting in Livermore to inform the public of summer 2011 road closures required for the SBA Improvement and Enlargement project;
- received Department of General Services approval on an interagency agreement with the Department of Parks and Recreation allowing for a conservation easement on property around Bethany Reservoir as part of the SBA Improvement and Enlargement project;
- renewed two expiring temporary construction easement agreements for the SBA Improvement and Enlargement project;
- received Department of General Services approval for a memorandum of understanding executed with the Department of Fish and Wildlife covering

mitigation lands acquired in support of the SBA Improvement and Enlargement Project;

- recorded Director's easement deeds pursuant to the stipulation agreement reached by the Attorney General's Office and Altamont Infrastructure Company, LLC, and enXco Windfarm V, Inc. in support of the SBA Improvement and Enlargement project; and
- recorded a signed correction deed and grant deed from Tejon Ranch and processed associated payment to correct an error in the original legal description and reconcile closing costs for the Tehachapi East Afterbay project.

Temporary Permits

DWR obtained 117 temporary permits in support of SWP projects, including:

- Arroyo Pasajero, Phase II, 4;
- Doughty Cut flow monitoring station project, 7;
- East Branch Extension, Phase II project, 1;
- Georgiana Slough nonphysical barrier, 7;
- NBA Alternate Intake Project, 67;
- North Central Regional Office—South Delta monitoring stations, 1;
- North Central Regional Office—coordinated temporary entry permits, 5;
- Sacramento River channel improvements, 2;
- South Delta Improvements Program—predatory fish study, 2;
- South Delta Improvements Program—South Delta monitoring stations, 1;
- South Delta Improvements Program—temporary barriers, 3;
- South Delta Improvements Program—water seepage monitoring station, 3;
- South Delta ecosystem enhancement, 1;
- San Joaquin River restoration project, 11;
- SBA Milepost 39 repair, 1; and
- Walnut Grove water quality station, 1.

SWP Property Management

Property management activities during 2011 were as follows:

- managed leasing activities of SWP nonoperating properties, which produced an income of \$755,886;
- processed 25 encroachment permit applications and executed 22;
- collected fees of \$262,848 for review and inspection costs related to encroachment permit applications; and
- coordinated review of 19 tentative tract map developments within 1 mile of the California Aqueduct.

SWP Appraisals

The following appraisal activities were completed:

DWR completed 65 appraisals, 4 lease appraisals, and 2 appraisal reviews in 2011, including:

- East Branch Extension, Phase I project, two appraisals for permanent drainage easements;
- East Branch Extension, Phase II project, four appraisals;
- Delta Division, one appraisal for a grazing lease and one review for outside appraisal;
- Oroville Division, two appraisals for agriculture leases;
- BDCP, Reach I, 14 appraisals for multiple borings, access, and construction easements;
- BDCP, Reach II, 44 appraisals for various borings, access, and construction easements;
- Caltrans, State Route 99 widening project, one appraisal review;
- SBA, one appraisal for lease rate; and
- City of Palmdale, one appraisal of a drainage easement.

Table 12-1 Design Activities, January 1, 2011, through December 31, 2011, by Division

Division and Facility	Design Activity	Date Design Began	Design Actual/ Estimated Completion Date
Oroville Division			
Enterprise Bridge	Seismic analysis	March 2009	March 2011
Oroville O&M Subcenter	Garage shop design	January 2010	June 2011
Oroville Field Division	Security project	October 2009	September 2011
Sites Reservoir	North-of-the-Delta Offstream Storage Investigation studies	December 2009	March 2011
Brad Freeman Bike Trail	Bike trail realignment—design	January 2009	May 2012
Delta Facilities			
Fish screens at Sherman and Twitchell islands	New fish screens at existing siphons—10 sites	September 2007	On Hold
Frank's Tract	Pilot project—design	November 2007	June 2012
North Bay Aqueduct			
North Bay Aqueduct	Alternate intake study	October 2008	December 2016
South Bay Aqueduct			
South Bay Aqueduct Enlargement	Furnish and install 69 kV transmission line and 13.8 kV distribution line and Banks switchyard modifications	October 2006	September 2012
North San Joaquin Division			
Skinner Fish Facility	Research lab design	September 2010	March 2011
San Luis Division			
Gianelli Pumping-Generating Plant	Replace heating ventilation and air conditioning systems	March 2009	April 2011
Sisk Dam	Seismic re-evaluation	July 2007	March 2011
South San Joaquin Division			
Teerink, Chrisman, and Buena Vista pumping plants	Furnish and install 230 kV SF6 power circuit breakers	October 2009	March 2012
Edmonston, Chrisman, Teerink, and Buena Vista pumping plants	Replace septic tanks, sewage piping, and pumps	August 2007	April 2012
Tehachapi Division			
Edmonston Pumping Plant	Furnish spare parts for pumps and discharge valves	January 2009	June 2011
East Branch Enlargement			
East Branch Enlargement, Phase II	Preliminary design and environmental documents	March 2007	On Hold
Check 66	Trash rake improvement project	May 2010	September 2011
Mojave Division			
Pearblossom Pumping Plant, Administration Building	Design new administration building	March 2008	February 2011
Cedar Springs Dam	Replacement of conduits and miscellaneous work	October 2008	February 2011

Table 12-1 Design Activities, January 1, 2011, through December 31, 2011, by Division

Division and Facility	Design Activity	Date Design Began	Design Actual/ Estimated Completion Date
Santa Ana Division			
East Branch Extension, Phase I Improvements	Project planning and engineering feasibility studies for the Crafton Hills Reservoir enlargement	July 2007	February 2011
East Branch Extension, Phase II	Project planning and engineering feasibility studies	July 2008	September 2012
	Furnish ANSI ball valves	July 2008	January 2011
	Furnish ANSI butterfly valves	July 2008	January 2011
	Furnish AWWA butterfly valves	July 2008	February 2011
	Furnish pumps, motors, variable frequency drives, and excitation systems	July 2008	October 2011
	Furnish switchyard equipment, Citrus Pump Station	December 2003	November 2011
Perris Dam	Dam embankment remediation	January 2007	March 2013
	Emergency release extension	October 2006	December 2013
	Outlet tower study	January 2007	December 2012
Miscellaneous			
Sutter Bypass	Flood control improvements—Weir No. 2 rehabilitation	July 2006	April 2011
	Motor control center replacement	August 2008	December 2012
	Pumping plant control systems rehabilitation	August 2008	September 2012
State Water Project	Seismic loading criteria study	January 2010	June 2012
Early implementation program	Review	October 2008	June 2012
Local bridge seismic safety program	Design	October 2005	December 2011
Cache Creek Levee Mile 3.9 and Levee Mile 4.2	Emergency levee repair	January 2007	December 2012

Table 12-2 Construction Activities, January 1, 2011, through December 31, 2011, by Division

Sheet 1 of 4

Construction Division and Facility	Construction Contract (Specification Number)	Starting Date (Notice to Begin Work)	Acceptance Date (expected or actual)	Contract Costs (in thousands of dollars)
State Water Project—General				
State Water Project Supervisory Control and Data Acquisition System	Replace remote terminal units (08-12)	May 2009	July 2013	11,500
Communication Cable	Monitor, test, and repair copper communication cable and voice and data equipment (09-02)	July 2009	August 2012	1,173
Oroville Division				
Hyatt Powerplant	Refurbish pump-turbine Units 1, 3, and 5 (98-22)	February 1999	September 2011	9,864
	Refurbish pump-turbine Units 2, 4, and 6 (01-11)	November 2001	May 2011	16,966
Oroville Operations and Maintenance Center	Build new garage shop and perform site work (11-03)	August 2011	May 2013	1,192
Oroville Wildlife Area	Construct ponds for wetland creation (10-07)	August 2010	March 2012	0
Warehouse, Civil Maintenance Building, and Welding Shop Building	Replace roofs (08-07)	June 2008	September 2011	497
North Bay Aqueduct				
Napa Turnout Reservoir	Replace reservoir (07-01)	April 2007	January 2012	11,281
Pipeline Reach N3B	Modify pipeline for State Route 12 widening (10-21)	January 2011	October 2011	1,452
South Bay Aqueduct				
Del Valle Branch Pipeline and Surge Tank	Repair pipeline at landslide (08-14 change order)	December 2009	September 2011	9,522
South Bay Aqueduct Enlargement and Improvement				
Dyer Canal, Livermore Canal, Alameda Canal, and Del Valle Pipeline	Perform canal modifications (09-16)	October 2010	July 2012	21,760
Dyer Reservoir	Construct Dyer Reservoir (09-01)	July 2009	December 2012	13,340
Siphon and Check Structure Modifications	Modify and replace siphons and check structures (08-14)	September 2008	September 2011	3,916
	Furnish check structure equipment (08-21)	January 2009	January 2012	3,300
Transmission Line and Modifications to Banks Switchyard	Construct 69 kV transmission line and modify Banks Switchyard (09-06)	October 2009	January 2013	8,460
South Bay Pumping Plant	Furnish 45 cfs pump and motor units and one spare pump and motor (04-05)	November 2004	June 2012	7,370
	Furnish valves, actuators, and hydraulic power unit (04-20)	May 2005	June 2012	2,258
	Furnish switchyard equipment (05-10)	September 2005	June 2012	1,496
	Furnish 5 kV switchgear (05-05)	October 2005	June 2012	3,571
	Construct pumping plant enlargement—initial facilities (06-04)	August 2006	June 2012	16,604

Table 12-2 Construction Activities, January 1, 2011, through December 31, 2011, by Division

Sheet 2 of 4

Construction Division and Facility	Construction Contract (Specification Number)	Starting Date (Notice to Begin Work)	Acceptance Date (expected or actual)	Contract Costs (in thousands of dollars)
	Furnish power transformers (07-02)	April 2007	June 2012	4,666
	Complete pumping plant enlargement (07-18)	December 2007	May 2012	18,674
Surge Tanks	Seismically retrofit Surge Tank Nos. 1 and 2 (11-11)	October 2011	February 2013	3,919
North San Joaquin Division				
Delta Operations and Maintenance Center	Repair roof (08-07 change order)	August 2010	September 2011	40
	Generator replacement (06-10 change order)	September 2008	September 2011	208
San Luis Division				
Dos Amigos Pumping Plant	Replace trash rake system and trash racks (08-06)	January 2009	April 2012	3,407
Gianelli Pumping-Generating Plant	Replace heating, ventilation, and air conditioning system (10-22)	April 2011	March 2013	567
Gianelli Pumping-Generating Plant, Dos Amigos Pumping Plant, Coalinga Operations and Maintenance Subcenter, Check Sites, and Flowmeter Sites	Replace standby engine generators (06-10)	August 2006	September 2011	2,084
San Luis Canal	Repair canal lining, Mileposts 56.40 to 164.90 (07-20)	November 2007	November 2012	9,233
	Replace irrigation crossings, Milepost 113 (11-09)	September 2011	June 2012	242
Tehachapi Division				
Edmonston Pumping Plant	Replace pumps, Units W2, W4, W6, and W8 (02-10)	June 2003	May 2012	35,600
	Furnish and deliver spare parts (11-02)	June 2011	June 2013	5,159
Mojave Division				
California Aqueduct Reaches 18A and 22B	Seal and pave roads and parking areas (10-03)	July 2010	January 2013	3,149
California Aqueduct Reach 20B	Repair canal culvert at Milepost 344.38 (10-15)	August 2010	February 2011	257
Cedar Springs Dam	Replace conduits and perform miscellaneous work (10-06)	March 2011	July 2012	928
Pearblossom Pumping Plant	Construct 20,000 square-foot Leadership in Energy and Environmental Design gold-rated administration building (10-23)	February 2011	October 2012	11,506
Santa Ana Division				
East Branch Extension, Phase I				
Greenspot, Crafton Hills, and Cherry Valley Pump Stations	Furnish pumps, motors, and variable frequency drives (99-17)	November 1999	April 2011	4,657
	Furnish and install additional units (06-21)	October 2006	December 2011	4,062

Table 12-2 Construction Activities, January 1, 2011, through December 31, 2011, by Division

Sheet 3 of 4

Construction Division and Facility	Construction Contract (Specification Number)	Starting Date (Notice to Begin Work)	Acceptance Date (expected or actual)	Contract Costs (in thousands of dollars)
East Branch Extension, Phase I Improvements				
Yucaipa Connector Pipeline	Furnish 42-inch and 48-inch AWWA valves (09-04)	August 2009	August 2011	233
	Construct 42-inch diameter pipeline (10-12)	October 2010	December 2012	2,842
Crafton Hills Reservoir Enlargement	Increase operating storage of the reservoir (11-12)	December 2011	August 2013	3,674
East Branch Extension, Phase II				
Valves	Manufacture, test, and deliver 3 energy dissipating valves for Citrus Reservoir (10-10)	September 2010	March 2013	700
	Manufacture, test, and deliver 14 ANSI butterfly valves for Citrus, Crafton Hills, and Cherry Valley pump stations (10-16)	January 2011	September 2013	1,147
	Manufacture, test, and deliver 12 AWWA butterfly valves for Crafton Hills and Cherry Valley pump stations and Mentone Pipeline (10-17)	February 2011	September 2013	162
	Manufacture, test, and deliver 12 ANSI ball valves for Citrus, Crafton Hills, and Cherry Valley pump stations (10-18)	January 2011	October 2013	2,748
Transformers	Manufacture, test, and deliver transformers and accessories for Citrus Pump Station (10-20)	March 2011	November 2013	556
Santa Ana Pipeline	Repair 13 sections of pipeline (11-07)	August 2011	July 2012	1,419
West Branch				
West Branch (Reach 29G) General	Construct road and embankment improvements (10-03 change order)	July 2011	January 2013	831
Oso Pumping Plant	Construct civil maintenance and mobile equipment building (07-22)	December 2007	December 2012	4,048
Coastal Branch				
Coastal Aqueduct under State Route 46	Encase existing steel pipeline (10-01)	April 2010	December 2011	1,770
Multiple Divisions				
Delta Facilities, Suisun Marsh Facilities, and California Aqueduct	Install and remove temporary rock barriers—2010 to 2012 (09-21)	March 2010	December 2012	18,331
Banks Pumping Plant and Teerink Pumping Plant	Furnish spare coils and materials (06-27)	February 2007	August 2012	2,551
San Luis and San Joaquin Field Divisions	Seal and pave roads and parking areas—2010 (10-02)	August 2010	January 2011	1,125
Buena Vista Pumping Plant and Chrisman Pumping Plant	Roofing repairs (10-19)	October 2010	January 2013	990
Miscellaneous Activities (Non-SWP)				
San Joaquin River Miles 41.4L, 42.1R, 42.5R, and 42.8R	Repair levee erosion and protect banks (09-18)	October 2009	September 2011	934

Table 12-2 Construction Activities, January 1, 2011, through December 31, 2011, by Division

Sheet 4 of 4

Construction Division and Facility	Construction Contract (Specification Number)	Starting Date (Notice to Begin Work)	Acceptance Date (expected or actual)	Contract Costs (in thousands of dollars)
San Joaquin River Mile 71.5R	Emergency levee erosion repair (11-01)	January 2011	May 2011	880
	Repair levee erosion and protect banks (11-06)	September 2011	January 2013	3,343
San Joaquin River, Mariposa Bypass and Eastside Bypass	Repair levee crown roads (11-08)	July 2011	September 2011	697
Colusa Sacramento River State Recreation Area	Restore habitat (08-13)	October 2008	August 2012	942
Sycamore Creek	Restore habitat (10-14)	October 2010	October 2014	390
Jensen River Ranch (Phase III)	Restore habitat (11-05)	September 2011	May 2012	733
Sutter Bypass	Replace motor control centers and control system at Pumping Plant No. 1, Pumping Plant No. 2, and Pumping Plant No. 3 (10-09)	December 2010	February 2013	5,564
Sutter Bypass, Willow Slough	Replace existing fish ladder (10-05)	June 2010	March 2013	3,124
Sutter Bypass, East Borrow Canal	Replace Weir No. 2 (10-08)	April 2011	March 2014	4,365
Sycamore Creek, Chico Creek, Mud Creek, and Sandy Gulch	Remove sediment (10-13)	September 2010	February 2011	447

Chapter 13

Recreation

Every winter, Bald Eagles are a popular attraction at Silverwood Lake State Recreation Area.

Significant Events in 2011

The new concessionaire, Parks Management Company, began managing the recreation facilities at Pyramid Lake Recreation Area on January 1, 2011. Along with facility improvements, the result was a nearly 16 percent increase in visitor attendance over 2010.

This year's "Catch A Special Thrill" (C.A.S.T.) fishing events, in partnership with the C.A.S.T. for Kids Foundation fishing program, were the subject of two major media shows. The event at Lake del Valle was reported on a KGO Radio program, "Spotlight 810," and the event at Lake Perris was featured on the *Funky Fishing Show*. These programs detailed the work that the Department of Water Resources (DWR) is doing for disabled and disadvantaged youth throughout California.

DWR contracted with the California Department of Parks and Recreation (California State Parks) and the Los Angeles County Department of Parks and Recreation to implement vessel inspections and outreach at San Luis Reservoir, O'Neill Forebay, Los Banos Reservoir, Pyramid Lake, and Castaic Lake. These reservoirs were assessed to be at high risk for quagga and zebra mussel infestations.

Information for this chapter was provided by the Division of Integrated Regional Water Management, Public Affairs Office, Division of Environmental Services, and the State Water Project Analysis Office.

The State Water Project (SWP) is a multipurpose project that provides recreational benefits to millions of Californians. In addition to providing water supply, flood control, and habitat for fish and wildlife, the SWP offers extensive and varied recreational opportunities—tours, sightseeing, fishing, hunting, picnicking, camping, boating, water skiing, bicycling, hiking, and swimming. Under the Davis-Dolwig Act (DDA), these recreational opportunities, as well as fish and wildlife enhancements, are not allocable as water and power costs to the SWP water contractors. They are financed by Department of Water Resources' (DWR) existing authorities under the Burns-Porter Act and appropriations from the Legislature specifically for these purposes.

Recreation Areas

The SWP has 37 developed recreation areas, or sites, throughout California, including 18 developed fishing access sites. Figure 13-1 shows the name and location of each area.

Recreation Use

In 2011, SWP facilities supported an estimated 4.1 million recreation days of use (Table 13-1), down somewhat from the 4.3 million reported in 2010, and 4.2 million reported in 2009. A recreation day is defined as one individual user visiting a recreation site along the SWP within all or part of a 1-day period.

Attendance was mixed at SWP reservoirs. The largest increase in 2011 occurred at Pyramid Lake with a 15.9 percent increase in visitor attendance. This was likely due to a combination of the facility improvements that DWR performed, and the marketing of the concessionaire that started at the beginning of 2011. The Vista del Lago Visitors Center also saw a 5.4 percent increase in their annual attendance.

Lake Oroville and Thermalito Forebay experienced a 7.7 percent increase in attendance, and Lake del Valle also had an 11.1 percent increase, despite having campground closures for 6 months.

Frenchman Lake was estimated to have had a 4.9 percent decrease in attendance.

Lake Davis had a 35.8 percent decrease in attendance. There was a closure of the Grasshopper Flat and Grizzly campgrounds due to a summer-long tree health and safety thinning operation at these locations that might have contributed to the decrease in attendance.

Lake Perris experienced a 6.8 percent decrease in attendance, most likely due to the continued low water levels implemented and maintained as a result of Perris Dam safety concerns.

Most SWP recreation use is concentrated at the major reservoirs, with 38 percent occurring at the lakes in the Oroville Field Division and 43 percent of the total SWP recreational use in 2011 occurring at the four major reservoirs in Southern California: Pyramid Lake, Castaic Lake, Silverwood Lake, and Lake Perris.

After re-evaluating the total recreation days since the SWP began delivering water in 1962, it was determined that SWP recreation has contributed to more than 227 million recreation days, approximately 7 percent higher than reported in prior bulletins.

Figure 13-1 Names and Locations of SWP Recreation Areas

Table 13-1 Estimated Recreation Days in 2011, by Field Division and Facility

Field Division and Facility	Number of Recreation Days (rounded)
Oroville Field Division	
Frenchman Lake	58,300
Antelope Lake	29,400
Lake Davis	24,600
Lake Oroville and Thermalito Forebay	907,900
Thermalito Afterbay and Oroville Wildlife Area	271,100
Feather River Fish Hatchery	175,900
Lake Oroville Visitors Center	94,600
<i>Subtotal</i>	<i>1,561,800</i>
Delta Field Division	
Lake del Valle	388,300 e(1)
Bethany Reservoir	2,500 e(2)
Fishing Access Site:	
Niels Hansen	300 e
California Aqueduct:	
Walk-in Fishing	800 e
Bikeway	300 e
White Slough Wildlife Area	12,000 e
<i>Subtotal</i>	<i>404,200</i>
San Luis Field Division	
San Luis Reservoir SRA: San Luis Reservoir, O'Neill Forebay, and Los Banos Reservoir	189,200
Romero Overlook Visitors Center	135,400
California Aqueduct:	
Walk-in Fishing	200 e(3)
Wildlife Areas	1,700 e(3)
<i>Subtotal</i>	<i>326,500</i>
San Joaquin Field Division	
Fishing Access Sites: Kettleman City, Lost Hills, Buttonwillow, and California Aqueduct	
Walk-in Fishing	25,700 e
<i>Subtotal</i>	<i>25,700</i>
Southern Field Division	
Silverwood Lake	260,100 e(4)
Lake Perris	567,800 e(4)
Vista del Lago Visitors Center	155,900
Pyramid Lake	123,500
Castaic Lake and Castaic Lagoon	649,800
Fishing Access Sites:	
Quail Lake	1,700 e
77th Street East	700 e
Longview Road	100 e
California Aqueduct:	
Walk-in Fishing	1,700 e
Bikeway	2,100 e
<i>Subtotal</i>	<i>1,763,400</i>
Total for Recreational Sites	3,695,700
Total for Visitors Centers	385,900
Grand Total	4,081,600

Note: these values are provided by facility operators and numerous other sources, and vary in their degree of accuracy. Recreation days are based on counts, except where marked "e," which are based on partial data; e(1) data were affected by campground closures for 6 months of the year and short-staffing; e(2) is based on data that are counted by California State Parks Thursday through Sunday only; e(3) fishing access on or adjacent to the dams has been eliminated due to security concerns resulting in a significant decrease in attendance in the general area; e(4) starting in 2011, all Southern Field Division locations are reporting attendance on a calendar-year basis.

Visitation at DWR's three SWP educational visitor centers totaled:

- Lake Oroville Visitors Center, 94,600 recreation days;
- Romero Overlook Visitors Center, San Luis Reservoir, 135,400 recreation days; and
- Vista del Lago Visitors Center, Pyramid Lake, 155,900 recreation days.

Overall, recreation usage of 4.1 million recreation days at the SWP facilities listed in Table 13-1 contributed to the more than 67.9 million day-use visitors at the 279 units of the California State Park System in fiscal year 2011–2012.

Facilities

In 2011, the following activities occurred or were planned for SWP facilities.

Planning

Antelope Lake Recreation Area

DWR began obtaining estimates to make improvements to the shoreline trail along the peninsula at Long Point Campground, which was originally designed to accommodate users with limited mobility. The trail no longer accommodates these users.

Lake Oroville State Recreation Area

The California Department of Parks and Recreation (California State Parks) made the following plans in 2011 for future improvements to the facilities at Lake Oroville State Recreation Area:

- build a North Fork Trail extension, to be funded by a Recreational Trails Program grant;
- build two environmental equestrian campsites that will be built by California State Parks and funded by DWR and the Recreational Trails Program grant;
- install LED lighting at Lake Oroville Visitors Center;

- install energy efficient lighting at the Lake Oroville Marina parking lot and in all Lake Oroville campgrounds to reduce expenses;
- install a new sewage treatment plant at Lake Oroville Marina;
- rebuild the benches at Loafer Creek campfire center; and
- replace the decking on the Bidwell Bar Bridge.

Lake del Valle State Recreation Area

East Bay Regional Park District is preparing to replace a campground restroom with a new restroom, funded partially by park entrance fees.

Pyramid Lake Recreation Area

Parks Management Company is considering installing shower facilities at the Pyramid Lake Los Alamos Campground. These facilities would be movable buildings with coin-operated showers. In addition, it is considering a boat rental facility and a water play park at Vaquero Beach that would utilize inflatable and semi-rigid floating structures such as trampolines and obstacle courses.

New Facilities

During 2011, new facilities were completed at the following sites.

Lake Oroville State Recreation Area

California State Parks performed a significant amount of trail improvements at Lake Oroville State Recreation Area during 2011.

California State Parks installed 167 trail mileage markers every half-mile along the entire trail system, which was funded by DWR. The markers were installed to both increase safety and decrease response time by emergency personnel along the trail system.

The Rattlesnake Hill Trail was redesigned to accommodate users with limited mobility. This work was designed and performed by California State Parks and funded by an Environmental Enhancement and Mitigation Program grant.

In addition, an unpaved trail at the spillway was paved, making it accessible to users with limited mobility.

California State Parks installed new barrier cables around the perimeter of the Nelson Bar parking area, installed fencing at Ponderosa Dam to discourage unauthorized off-road use, and, along with DWR, purchased a new sewage pump boat to service the 6 floating restrooms and 10 floating campsites.

Lake del Valle State Recreation Area

East Bay Regional Park District installed electrical hookups at 21 existing campground RV sites at the Del Valle Campground. It also replaced Del Valle Building 8 with a new restroom.

The Division of Boating and Waterways installed a new west-side boat dock and gangway to accommodate users with limited mobility. Electrical power was also provided to the quagga and zebra mussel inspection trailer.

San Luis, Pyramid, and Castaic Lake State Recreation Areas

DWR contracted with California State Parks and the Los Angeles County Department of Parks and Recreation to implement vessel inspections and outreach at San Luis Reservoir, O'Neill Forebay, Los Banos Reservoir, Pyramid Lake, and Castaic Lake. These reservoirs were assessed to be at high risk for quagga and zebra mussel infestations, based upon habitat suitability, and were not covered by any existing inspection program. These contracts are limited to a 3-year term. The inspection

methods were replicated from methods used at Silverwood Lake and Lake Perris, and inspection bands are being accepted from other inspection programs.

DWR routinely monitors SWP reservoirs and the Sacramento-San Joaquin Delta for the presence of quagga and zebra mussels. For more information, see Chapter 3, Environmental Programs.

Silverwood Lake State Recreation Area

California State Parks completed construction of a dreissenid mussel vessel inspection station, including installation of a modular kiosk for staff operations, and a five-lane, fence-secured area with a concrete surface for vessel inspections.

Improvements to Facilities

During 2011, improvements were made at the following facilities.

Frenchman Lake Recreation Area

The U.S. Forest Service began construction of a shoreline access trail at the Frenchman Dam area and installed showers at the Big Cove Campground.

Lake del Valle State Recreation Area

East Bay Regional Park District performed the following improvements specifically to accommodate users with limited mobility:

- demolished the old boat house on the west side and installed a picnic site;
- completed a campfire ring conversion for 150 sites;
- converted Wild Turkey Group Camp into a camp to accommodate users with limited mobility;
- replaced water fountains at Arroyo Road Staging Area and the Amphitheater with high/low drinking fountains;
- installed new asphalt pathways on the west side from the parking lot to the

visitors center and the new west boat dock; and

- replaced two side walls at the east concession area.

Pyramid Lake Recreation Area

Parks Management Company began managing the recreation facilities at Pyramid Lake Recreation Area on January 1, 2011. This allowed facilities such as Vaquero Beach to be open 7 days a week for the first time in 5 years, and a campground reservation system was initiated.

The following improvements were made in 2011.

Restroom Repairs. All five septic systems were repaired and cleaned out. Most of the restrooms had electrical issues that were repaired, and new hardware and paint were added.

Emigrant Landing Day Use Area. The electrical infrastructure was completely overhauled. Both gate houses were revamped and were made operational for the 2011 summer season. All parking lots and roadways were replaced or slurry coated; stairways from the upper to lower parking areas were replaced; and a new fishing area, which included ramps, walkways, tables, and railings to provide for public safety and to accommodate access for users with limited mobility, was installed.

A 60 foot by 14 foot building was installed at Emigrant Landing to be used as a general store for visitors. It will carry food, nonalcoholic drinks, camping gear, fishing tackle, and boating equipment.

DWR assisted with the clean-up of a boat storage facility at Emigrant Landing for use by approximately 45 trailers. The facility opened on Independence Day weekend.

Water Infrastructure. Dozens of leaks and broken pipes were identified and repaired.

Tree Planting Project. Parks Management Company planted more than 100 trees throughout the Los Alamos Campground near Pyramid Lake. In addition, irrigation pipe was laid around every tree.

Signage. Nearly every sign around Pyramid Lake is being replaced, including road signs and highway markers. This project is expected to be completed by Memorial Day, 2012.

Fire Rings and Barbeques. To accommodate access for users with limited mobility, 60 fire rings are being replaced with modern fire rings in campgrounds (Emigrant Landing, Vaquero Beach, and Spanish Point). The project is expected to be completed by Memorial Day, 2012.

Silverwood Lake State Recreation Area

California State Parks replaced 700 feet of paved bicycle trail near Cleghorn Day Use Area.

The Division of Boating and Waterways finished improvements to the Live Oak Boat-In Site. The project consisted of demolition and removal of six existing shade ramadas and the installation of eight new shade ramadas, eight picnic tables, eight trash bins, eight concrete pads, and one project sign that was located near the existing restroom. Some minor grading work was performed. The improved facilities were designed to accommodate users with limited mobility. The total cost was \$141,000.

Lake Perris State Recreation Area

California State Parks removed a 6,000 gallon steel fuel storage tank from the marina parking lot, along with 100 feet of buried fuel supply line and associated electronic systems.

Recreation Activities

The SWP, with its many reservoirs and hundreds of miles of aqueducts, offers Californians many recreational opportunities. From Antelope Lake in Northern California to Lake Perris in Southern California, the SWP includes facilities for anglers, boaters, campers, hikers, cyclists, and many others. While DWR manages the routing of water through the reservoirs, the recreational facilities are operated variously by federal, State, and local agencies and, in many cases, their private concessionaires. Visitors to SWP facilities can swim, water ski, and picnic, as well as enjoy other activities. See Figure 13-2 for the various types of recreation available along the SWP.

Lake Oroville State Recreation Area

DWR, California State Parks, and their many other agencies sponsored the following activities in 2011:

- DWR co-hosted a Jack Splash Fit-N-Fun Day with the Oroville YMCA at the North Forebay, near the Aquatic Center. Two hundred fifty children came to learn the value of exercise and healthy eating habits through various activities with staff.
- DWR and California State Parks helped support, through a contract with the Oroville Chamber of Commerce, the annual Oroville Salmon Festival. This 2-day fall event was held at the Feather River Fish Hatchery and downtown Oroville, and was attended by an estimated 8,000 participants.
- DWR co-hosted a 2-week Aquatic Adventure Camp program with the Feather River Recreation and Park District and the Chico Area Recreation District, for 26 local children. They were educated in sailing, canoeing, sail boarding, proper use of safety equipment, water safety, and rescue techniques by Forebay Aquatic Center staff.

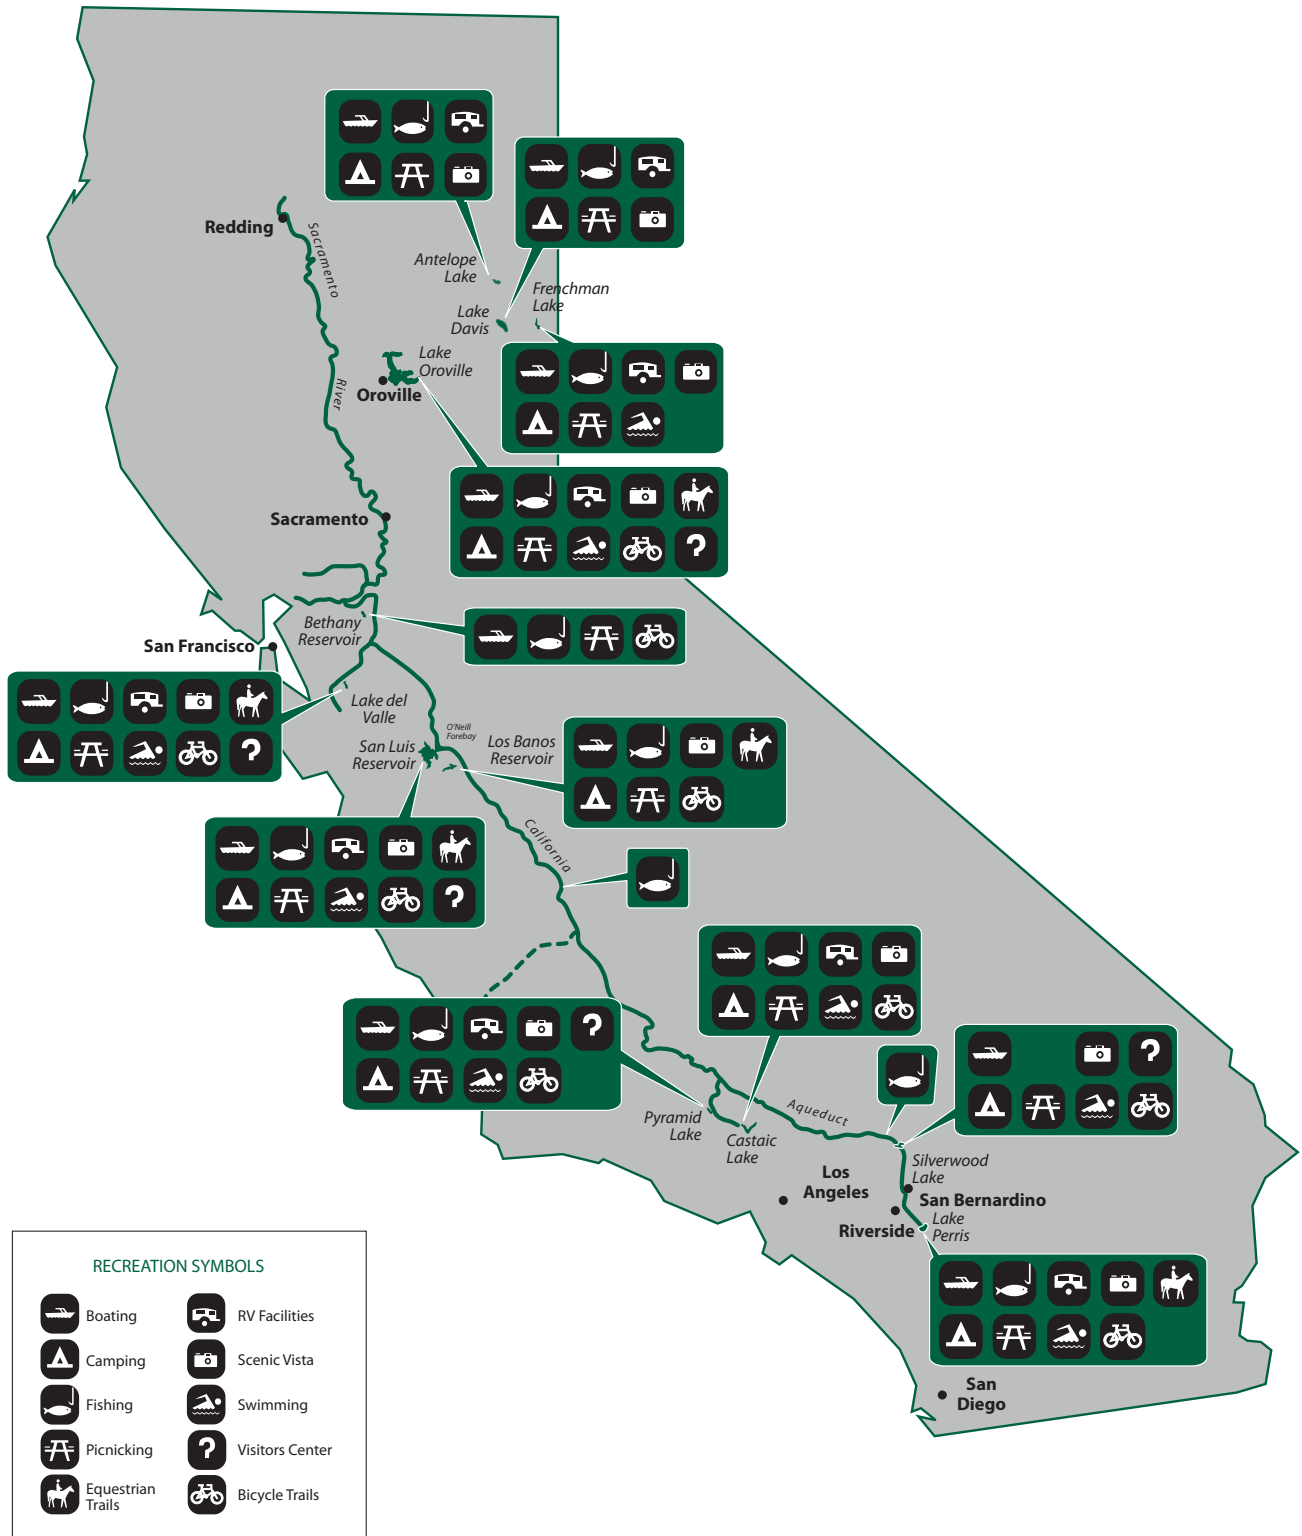

Figure 13-2 Types of Recreation along the SWP

- DWR, California State Parks, and the Department of Forestry and Fire Protection hosted a Catch A Special Thrill (C.A.S.T.) fishing event for 34 disabled and disadvantaged children.
- California State Parks held a trail clean-up day. It was estimated that 25 cubic yards of trash and tires were removed from the areas, by 45 volunteers from the public and California State Parks.
- California State Parks held the annual Spring Wildflower Wilderness Festival and 300 visitors attended.
- DWR and California State Parks held a Native Ways Celebration. Two hundred attendees learned about Maidu culture and history.
- California State Parks hosted Bidwell Bar Days at Bidwell Canyon Campground. Three hundred eighty-six visitors were treated to a day in the life of the old west.
- California State Parks hosted Frontier Christmas at the Lake Oroville Visitors Center. Visitors learned how to make pioneer crafts and pan for real gold. An estimated 1,086 people attended the event.

Lake del Valle State Recreation Area

East Bay Regional Park District sponsored the following activities in 2011:

- held the Newfoundland Water Dog Trials;
- hosted the Tri-Valley Masters Open Water Swim;
- held the Ohlone 50K Run;
- hosted the Two Day Town Music Festival;
- hosted 30 campfire programs serving 2,758 individuals;
- hosted seven school programs serving 209 children;
- hosted 12 Regional In Nature programs led by naturalists serving 214 individuals and 20 non-Regional In Nature programs serving 365 individuals;
- hosted a Community Outreach Overnight Program serving 250 individuals;

- hosted a “Park’n It” Summer Day Camp Program serving 65 children;
- held a Coastal Clean-up Day where 242 volunteers cleaned up the lake shoreline. Volunteers worked more than 968 hours and removed 542 pounds of trash;
- hosted five fishing programs serving 38 participants;
- with DWR and the Richmond Police Athletics League, co-sponsored two Aquatic Adventure Camps that served 80 children;
- with DWR and the Livermore Area Recreation and Park District, co-sponsored one Aquatic Adventure Camp that served 40 children; and
- with DWR, hosted the annual C.A.S.T. fishing event, which paired 32 disabled and disadvantaged children with experienced fishermen for a day of fishing on Lake del Valle. The event was featured in a special KGO Radio “Spotlight 810” report that aired later that summer.

Castaic Lake State Recreation Area

The County of Los Angeles Department of Parks and Recreation sponsored the following activities in 2011:

- hosted two Junior Lifeguard programs for 535 participants;
- conducted three Aquatic Adventure Camp sessions for 400 participants;
- taught four moonlight kayak classes with 80 participants in each class—the participants learned about the environment at Castaic Lake, the SWP, water safety, and boating safety;
- hosted “Splash in the Water” events with 400 children who learned about water safety, kayaking, canoeing, stand-up paddleboarding, and sailing;
- held two sessions of FamCamp programs for 80 participants, to teach about camping, leave-no-trace principles, water safety, and kayaking;

- taught 30 stand-up paddleboarding classes to a total of 300 participants, every Saturday from May through October, with an average class size of 25 participants;
- hosted 30 kayak clinics for a total of 500 participants, every Saturday from May through October, to teach about water safety, boating safety, and the environment at Castaic Lake; and
- hosted, along with DWR, a C.A.S.T. fishing event for 51 disabled and disadvantaged children.

Silverwood Lake State Recreation Area

California State Parks sponsored the following activities:

- held Bald Eagle tours every Saturday from January through March;
- hosted an Adopt-a-School program for 100 participants;
- hosted five school barge tours for 105 participants;
- held a Coastal Clean-up Day where six volunteers cleaned up the shoreline;
- conducted several Outdoor Youth Connection events where select urban middle and high school students came to the park to learn leadership and life skills; and
- hosted, along with DWR and its partner agencies, a C.A.S.T. fishing event on Silverwood Lake, which paired 37 disabled and disadvantaged children with experienced fishermen for a day of fishing.

Lake Perris State Recreation Area

California State Parks sponsored the following activities:

- hosted 12 Junior Ranger programs conducted by a State Park Interpreter for participants aged 3–15. Programs were

held Saturday mornings from Memorial Day weekend through Labor Day;

- hosted 12 campfire programs;
- hosted a Junior Lifeguard program for 25 participants, aged 8–15 years. This 4-week program taught children about natural and cultural resources, first aid, and CPR. It also helped children gain experience needed to apply for a job as a State lifeguard;
- participated in a national Bald Eagle count;
- with DWR, hosted three sessions of Aquatic Adventure Camp. More than 150 children participated in this program and learned basic first aid, CPR, how to manage basic aquatic emergencies, swimming strokes, and a variety of aquatic recreation activities; and
- with DWR and its partner agencies, hosted a C.A.S.T. fishing event, which paired 14 disabled and disadvantaged children with experienced fishermen for a day of fishing on the lake. The event was also featured on the *Funky Fishing Show*, a late-night cable television program that emphasized the joys of fishing.

Oroville Recreation Plan

The Oroville Facilities, including Lake Oroville State Recreation Area, Oroville Wildlife Area, and adjacent DWR facilities, are operated in conformance with the 1993 Amended Recreation Management Plan that was approved by the Federal Energy Regulatory Commission (FERC) in its 1994 Order 2100-054. In 2006, DWR and its Settlement Agreement signatories submitted a new Settlement Agreement Recreation Management Plan (SARMP, March 2006) for FERC approval. The approved SARMP will be implemented when the new hydropower license is issued by FERC, currently expected sometime in 2014 or later.

Additional need-based recreation improvements identified and proposed in

the SARMP are anticipated to be constructed after the new FERC license is issued. The new license terms and conditions are expected to be consistent with the proposed SARMP. In the meantime, DWR and its DDA collaborating partners California State Parks, California State Parks' Division of Boating and Waterways (formerly the Department of Boating and Waterways), and the Department of Fish and Wildlife (DFW) will continue to operate Oroville Facilities' recreational installations consistent with the existing FERC license (renewed annually) and its associated 1993 Amended Recreation Management Plan.

Fish Plantings

In 2011, DFW planted 761,200 fish in SWP reservoirs (see Table 13-2), 41 percent more than the 538,500 fish planted in 2010, but less than the 879,500 fish planted in 2009.

With the exception of Silverwood Lake, all of the SWP reservoirs received more fish in 2011. Silverwood Lake received 35 percent less than in 2010. However, Lake Davis received 66 percent more Eagle Lake Trout than in 2010, and Frenchman Lake received 132 percent more Eagle Lake Trout than in 2010. Lake Oroville received 25 percent more Coho Salmon than in 2010, and Pyramid Lake and Lake Perris received 103 percent and 24 percent more trout, respectively, than in 2010.

SWP Deliveries for Recreation

DWR has an agreement with California State Parks to provide onshore recreation water at several SWP facilities in an amount prorated to the yearly SWP Table A allocation. Per the 80 percent SWP Table A allocation for 2011, maximum diversion amounts under the onshore recreation agreement were allocated at 80 percent, or a total of 5,424 acre-feet (af), as follows: 2,200 af at

San Luis Reservoir; 320 af at Lake del Valle; 1,864 af at Castaic Lake and Castaic Lagoon; 1,000 af at Lake Perris; and 40 af at Bethany Reservoir. Actual deliveries under the agreement totaled 553 af as follows: 2 af at San Luis Reservoir, 122 af at Lake del Valle, 221 af at Castaic Lake, 208 af at Lake Perris, and 0 af at Bethany Reservoir. DWR also delivered 81 af to California State Parks at Silverwood Lake and 23 af at Pyramid Lake. Further detail on these deliveries is provided in Chapter 9, Water Contracts and Deliveries.

Recreation Financing

Prior to 2001, DWR reported capital costs allocated to fish and wildlife enhancement and recreation in Bulletin 132, Appendix D, *Costs of Recreation and Fish and Wildlife Enhancement (R&FWE)*. This report is no longer mandated by the Legislature. DWR initially began reporting recreation capital cost information in this bulletin for fiscal year 2000–2001.

The approach to financing R&FWE in connection with the SWP is provided in the DDA (California Water Code [CWC] Sections 11900–11925, 1961) and the Burns-Porter Act (CWC Section 12937, 1959). Additionally, as early as 1953, financing for R&FWE was addressed in CWC Sections 233, 345, 346, 12581, and 12582. These statutes declare that recreation at the SWP is a benefit to all the people of California and that the associated costs should be borne by all Californians. While this intent is cited in the DDA, no specific appropriation or funding source was defined. Consequently, Assembly Bill (AB) 12 in 1966, Senate Bill (SB) 1268 in 1970, and the Environmental Water Act, AB 1441 and AB 1442 in 1989, were all enacted to provide the necessary State funding for this SWP purpose. The DDA does, however, explicitly preclude DWR from including R&FWE costs in the SWP charges for water and power billed to the public water agencies contracting for SWP water supply.

Table 13-2 Fish Planted by Department of Fish and Wildlife in 2011 (thousands)

Location and Size	Eagle Lake Trout	Brook Trout	Rainbow Trout	Coho Salmon	Chinook Salmon	Kokanee Salmon	Total for Lake
Antelope Lake							48.4
Catchables	17.1	13.8	17.5				
Lake Davis							88.4
Fingerlings	32.8						
Catchables	55.6						
Frenchman Lake							178.9
Fingerlings	150.4						
Catchables	28.5						
Lake Oroville							229.6
Catchables				229.6			
Thermalito Forebay	No Fish Planted						
Lake del Valle							42.8
Fingerlings					15.0	20.0	
Catchables	4.2		3.6				
Los Banos Reservoir	No Fish Planted						
Pyramid Lake							49.3
Catchables	4.0		45.3				
Castaic Lake							55.2
Catchables			55.2				
Castaic Lagoon	No Fish Planted						
Silverwood Lake							26.4
Sub-catchables	9.7						
Catchables	16.7						
Lake Perris							42.2
Catchables	6.6		35.6				
Super-catchables			0.02				
Total	325.6	13.8	157.2	229.6	15.0	20.0	761.2

Note: DFW provided this information. It uses the following size classes:

fingerlings = 16.1 or more fish/pound; sub-catchables = 6.1 to 16 fish/pound; catchables = 1 to 6 fish/pound;

super-catchables = 0.99 to 0.34 fish/pound; and trophy = fewer than 0.32 fish/pound.

The Legislature has intermittently appropriated monies to meet State obligations to fund R&FWE at the SWP. AB 12 appropriated \$5 million per year to DWR from \$90 million tidelands oil and gas revenues. By the early 1980s, DWR had expended the entire \$90 million toward funding SWP R&FWE obligations. SB 1268 appropriated \$55 million to California State Parks and \$5 million to DFW specifically for their responsibilities under the DDA at SWP facilities. Finally, AB 1442 appropriated \$172 million to reimburse DWR for SWP R&FWE costs incurred over the previous dozen years as an offset to DWR's California Water Fund repayment, and an additional \$30 million for SWP R&FWE through 1994.

While no other appropriations to DWR for SWP R&FWE costs have been made by the Legislature, DWR has used its authority under the Burns-Porter Act to carry out and fund all SWP project purposes, including R&FWE, with State Water Resources Development System revenues. The Legislature did, however, in the fiscal year 2011–2012 budget effective July 1, 2011, request that the Natural Resources Agency convene a DDA Working Group (WG) to develop an implementable solution to the SWP R&FWE funding dilemma. The WG consisted of the Natural Resources Agency's Secretary's Office as chair and included the Department of Finance, the Legislative Analyst's Office, legislative staff, DWR, and selected public water agency SWP water supply contractors. The WG was convened in late 2011, and was essentially tasked with identifying an implementable long-term solution to reliable SWP R&FWE funding, while also ensuring the Department of Finance and the Legislature remained in control of State general funds, which are separate and apart from funds authorized to DWR under the Burns-Porter Act.

Capital Cost Allocations

Table 13-3 shows capital costs allocated to R&FWE and overall costs of lands acquired for recreation development through 2011. Total capital costs increased by \$1,252,972 since Bulletin 132-11, due to an increase of \$1,252,340 in 2011 and an upward adjustment of \$632 in years prior to 2011. The increase in 2011 included \$1,225,090 in joint costs, and \$27,250 in specific costs. These costs are budgeted by DWR from funds available for financing project construction costs. Recreation and enhancement costs not reported in this table are budgeted by several State departments and are financed by appropriations from a variety of funds.

Accrued Interest Charges

Table 13-4 details accrued interest charges included in the costs shown in Table 13-3 and reimbursements through December 2011. These interest accruals were calculated through October 2001 on the portion of annual disbursements financed by the California Water Resources Development Bond Fund, based on the weighted average interest costs of Burns-Porter and Water System Revenue Bonds sold to date, and are reported here for historical reference. The reimbursements were included in DWR's budget as appropriations from the General Fund and are used by DWR to pay for operations, maintenance, power, and replacement costs associated with operating the SWP for R&FWE.

For a more detailed discussion of these legislative provisions, and DWR's procedures for reporting and tabulating recreation and enhancement costs, please see the last Appendix D (to Bulletins 132-98, 132-99, 132-00, and 132-01).

^a Accrued interest not calculated since October 2001 when SB 1191 amended CWC Section 11912 so that DWR was no longer required to report these costs annually to the Legislature or to submit cost allocations to the California State Parks' Division of Boating and Waterways, California State Parks, and the Department of Fish and Wildlife.

Chapter 14

Financial Analysis

Clifton Court Forebay.

Significant Events in 2011

On September 7, the Department of Water Resources (DWR) delivered \$92.275 million of Water System Revenue Bonds, series AI. The proceeds were presold on November 8, 2010, to refinance previously issued bonds and to pay bond financing costs.

On October 13, DWR delivered \$216.930 million of Water System Revenue Bonds, series AJ. The proceeds were presold on October 5 to refinance commercial paper and previously issued bonds, finance long-term construction expenditures, and pay bond financing costs.

Information for this chapter was provided by the State Water Project Analysis Office in conjunction with the Division of Fiscal Services.

This chapter presents both a summary and a detailed explanation of the State Water Project's (SWP) current financial analysis, capital costs and requirements, revenues and expenses, and bond activities for years 2011 through 2021.

The Department of Water Resources (DWR) performs a financial analysis annually to ensure the SWP financing program will have sufficient funds to meet construction obligations; project operation, maintenance, power, and replacement costs; and debt service payments for bonds expended for construction. The results of the current financial analysis, dated December 31, 2011, are presented in Tables 14-1 and 14-2, located at the end of this chapter. (Please note that, in some instances, the tables in this chapter may not sum due to rounding.)

Future contingencies may change the financial analysis, some of which include:

- alterations in schedules of currently planned construction for future facilities;
- changes in economic conditions, including changes in interest rates and in SWP water contractor Table A amounts due to changes in amounts of water needed, conserved, or reclaimed;
- development of additional sources of water not foreseen at this time;
- deviations from the assumptions regarding actual rates of price escalations for future construction from those currently assumed for cost estimates;
- increases in capital costs related to additional conservation facilities; and
- outcome of lawsuits now pending before the courts.

Capital Requirements and Financing

In conducting the current financial analysis, DWR projected future construction costs through the year 2021 plus reimbursement of \$82 million interim financing for prior expenditures will total \$1.61 billion. Special capital requirements for revenue bond financing of these construction costs are projected at \$162 million for a total capital requirement of \$1.77 billion. This projection includes construction and financing costs for the following significant SWP projects planned for completion by 2021:

- Perris Dam remediation;
- Phase II enlargement of the East Branch of the California Aqueduct;
- Phase I improvements to the East Branch Extension;
- Phase II of the East Branch Extension;
- enlargement of and improvement to the South Bay Aqueduct (SBA); and
- a new intake to the North Bay Aqueduct.

Most of these capital requirements will be financed from the projected sale of \$1.72 billion of revenue bonds. The remaining \$45 million will be financed from capital resources revenues and the transfer of excess revenues not needed for operation costs or debt service.

The analysis of capital requirements and financing presented in Table 14-1 does not include the costs and financing of all facilities needed to develop the remaining yield necessary to meet the

total 4.2 million acre-foot contractual commitment to long-term SWP water contractors. Table 14-1 also does not include the costs of associated work essential for realizing full benefits from the SWP, but financed and constructed by local interests or State agencies other than DWR. Those facilities include on-shore recreational developments at SWP facilities and local distribution facilities.

The allocation of capital expenditures for various SWP purposes is detailed in Table 14-3.

Capital Requirements

Lines 1 through 20 in Table 14-1 show actual and projected SWP capital requirements through 2021. Estimates of future capital expenditures include allowances for construction cost escalation of 5 percent per year from 2012 through 2021. Right-of-way costs are escalated at 4 percent per year from 2012 through 2021. Capital expenditures for the SWP also include requirements other than those for construction, such as disbursements made as part of the Davis-Grunsky Act Program (Line 16) and special capital requirements under revenue bond financing (Line 17). DWR will decide whether to construct facilities only after examining alternatives and completing environmental documentation and other review processes.

Line 1, Initial Project Facilities, includes only those facilities completed in the initial construction program, which concluded December 31, 1973 (see Bulletin 132-74, Chapter 2). Additional costs after 1973, and estimated costs of remaining work on the initial SWP facilities, are not included.

Line 2, North Bay Aqueduct, consists of the estimated costs for improvements and the historical costs for Phase II. Operational in May 1988, Phase II connected with the Phase I facilities, which were completed in 1968 (Phase I costs are included in the initial

project facilities discussed in Line 1). Phase II included costs for pipelines, pumping plants, and a small reservoir necessary to divert water from the western Delta to Napa and Solano counties for urban use. The improvements consist of replacing the existing tank with two 5-million gallon tanks. Construction of the new tanks began in 2007 and was completed in 2010.

Line 3, Delta and Suisun Marsh Facilities, shows historical costs that include planning for general Delta facilities and the previously planned peripheral canal and overland water delivery facilities for the western Delta. Also included are historical planning costs for Suisun Marsh as well as construction costs for the Suisun Marsh Salinity Control Gates and an access road. The projected amounts include projected planning costs plus projected costs for fish screens at Sherman and Twitchell islands.

Line 4, Final Four Units at Banks Pumping Plant, includes costs of the final four 1,067 cubic feet per second units, which became operational in spring 1992.

Line 5, Coastal Branch Aqueduct, includes all costs for the planning, design, and construction of Phase II of the Coastal Branch of the California Aqueduct. Phase II construction began in October 1993 and was completed in 1997. Water deliveries from Phase II facilities began in July 1997.

Line 6, West Branch Aqueduct, shows costs for all facilities on the West Branch except Warne Powerplant. Those costs are included in Line 11.

Line 7, East Branch Enlargement, includes expenditures for Phases I and II of the East Branch Enlargement. Phase I included the enlargement share of power plant costs at Mojave Siphon and Devil Canyon. (The remaining power plant costs are included in Line 11.) East Branch Enlargement costs for Phase I, by facility, are presented in

Table 14-3 Allocation of Capital Expenditures (in thousands of dollars)

Facilities and Construction Divisions	Expenditures Incurred Through 2011	Future Expenditures	Total	Preliminary Allocation Among Project Purposes

^aReflects DWR's allocation to this purpose, irrespective of federal payments.

^bIncludes costs currently unassigned to purpose, planning costs of deleted features of project facilities, initial costs of inventoried items, and costs assigned to the Davis-Grunsky Act Program.

Table 14-4. Costs for Alamo Powerplant consist of expenditures for Unit 1 facilities allocated to enlargement. Construction of Unit 2 was deferred.

Work on the environmental impact report, mapping, and preliminary design for Phase II of the enlargement began in March 2007. Construction is projected to be completed in 2020. Project costs include raising the canal embankment and concrete lining, constructing additional siphon barrels, adding bays to check structures, constructing Unit 2 at Alamo Powerplant, and adding two pump/motor units and a discharge line at Pearblossom Pumping Plant.

All costs in Line 7 are allocated to and repaid by the seven Southern California contractors participating in the East Branch Enlargement.

Line 8, East Branch Improvements, shows all aqueduct costs on the East Branch not allocated to the enlargement project. Those costs include improvements constructed concurrently with the enlargement work, the reconstruction of the San Bernardino Tunnel Intake, and the construction of the Tehachapi East Afterbay. Costs for power plant construction at Alamo, Mojave Siphon, and Devil Canyon are not included in this line.

Line 9, East Branch Extension, shows expenditures for Phases I and II of the extension of the East Branch of the California Aqueduct. The East Branch Extension extends the California Aqueduct east from the Devil Canyon Powerplant to a terminus at Noble Creek near Beaumont in Riverside County. The extension provides water service to the San Geronio Pass Water Agency and the San Bernardino Valley Municipal Water District. Construction of Phase I began in February 1999 and was completed in 2003. Phase I improvements include enlargement of the Crafton Hills Reservoir and construction of the Yucaipa Connector Pipeline. Construction of this phase is to be completed in 2013. Phase II will increase

the pumping capacity to 100 percent of design capacity. Construction of Phase II is anticipated to begin in 2012. All costs in Line 9 will be allocated to and repaid by the two participating contractors.

Line 10, South Bay Aqueduct Improvements and Enlargement, shows expenditures for providing additional capacity required to meet increases in water demands for the service area of Alameda County Flood Control and Water Conservation District, Zone 7, and increasing the existing capacity of the SBA to its original design capacity. Construction began in 2006 and is scheduled to be completed in 2013.

Line 11, Power Generation and Transmission Facilities, does not include the East Branch Enlargement share of costs for Alamo, Mojave Siphon, and Devil Canyon powerplants shown in Line 7 of Table 14-1. The capital costs for facilities included in Line 11 are shown in Table 14-5.

Line 12, Additional Conservation Facilities, shows projected costs to plan and study additional conservation facilities. Specific planning activities and projected spending amounts for 2012 through 2021 are shown in Table 14-6. Expenditures for these items are being reviewed. Construction costs of additional conservation facilities are not included in the financial analysis.

Line 12 does not include the Bay Delta Conservation Plan costs. DWR's share of the Bay Delta Conservation Plan expenditures for preliminary planning and environmental impact report preparation are currently financed by participating contractors.

Line 13, Agricultural Drainage Facilities, includes projected costs of the Agricultural Drainage Program. The activities in this program are monitoring, evaluating, reducing, and treating drainage, as well as investigating treatment and reuse of drainage water.

Table 14-4 East Branch Enlargement Capital Costs by Facility

Facility	Amount (in millions of dollars)
Aqueduct and Siphons	128.1
Pearblossom Pumping Plant	70.1
Alamo Powerplant	5.0
Mojave Siphon Powerplant	47.3
Devil Canyon Powerplant and Second Afterbay	202.9
Total	453.4

Geysers–Lakeville	6.9
<i>Subtotal</i>	<i>17.6</i>
Total	720.5

Table 14-6 Estimated Future Costs for Planning Additional Conservation Facilities

Activity	Amount (in millions of dollars)
SWP Future Water Supply	31.7
Other Planning Costs	0.0
Total	31.7

DWR assumes that future costs of the drainage program will be financed by revenue transfers (Line 36).

Line 14, Other Costs, includes items such as general design and construction costs, costs of completing operation and maintenance facilities, and costs of other completion activities for the initial facilities of the California Aqueduct. Portions of those costs ultimately will be allocated to California Aqueduct units described in the preceding paragraphs.

Line 15, Subtotal Project Construction Expenditures, is the total of Lines 1 through 14.

Line 16, Davis-Grunsky Act Program Costs, shows costs of the Davis-Grunsky Act Program, a financial assistance program to provide grants and loans to public agencies for constructing local water projects.

As of December 31, 2011, DWR had disbursed \$130 million (including \$8.5 million for administration) in grants and loans to local agencies throughout the State.

Line 17, Special Capital Requirements Under Revenue Bond Financing, presents special capital requirements at the time revenue bonds are sold. The financial analysis assumes that proceeds from any future revenue bonds will be used to pay for bond discounts, bond issuance costs, and debt service reserve requirements.

Information about the application of proceeds to these special requirements for actual and assumed revenue bond sales is presented in Table 14-7.

Line 18, Total Capital Requirements, is the total of Lines 15, 16, and 17.

Line 19, Power Facilities Capital Requirements, shows the total capital requirements for power facilities included in Line 18.

Line 20, Water Facilities Capital Requirements, shows the total capital requirements for water facilities included in Line 18.

Capital Financing

The SWP was constructed using three general types of financing: Burns-Porter Act, revenue bonds, and capital resources. Lines 21 through 37 of Table 14-1 present specific information about these financing sources.

Burns-Porter Act

Burns-Porter Act financing is derived from the sale of California Water Resources Development Bonds (general obligation bonds) and State tideland oil revenues deposited in the California Water Fund as authorized by the Burns-Porter Act (California Water Code Sections 12930–12944), approved by voters in November 1960. The Burns-Porter Act authorized an issuance of \$1.75 billion of general obligation State bonds, which are repaid by revenues received according to the water supply contracts. Of that authorization, \$130 million was reserved specifically for the Davis-Grunsky Act Program.

Proceeds from the sale of general obligation bonds were deposited in the California Water Resources Development Bond Fund—Bond Proceeds Account, from which monies were expended only for the construction of SWP facilities and for the Davis-Grunsky Act Program. Approximately 26 percent of the expenditures through 2011 for construction and the Davis-Grunsky Act Program were financed with general obligation bonds.

Monies deposited in the California Water Fund were appropriated for purposes outlined in the Burns-Porter Act. Such deposits were derived from a portion of the

Table 14-7 Application of Revenue Bond Proceeds (in millions of dollars)

^a Actual bond issue for all except future East Branch Enlargement, future East Branch Extension, future South Bay Aqueduct Improvements and Enlargement, and future Water System Facilities bonds.

^b Bond financing and refunding costs include funds applied to debt service reserve requirements.

^c Includes \$4,580.9 million of refunded principal, leaving a net principal obligation of \$3,912.1 million.

State tideland oil revenues, in accordance with a continuing authorization. The California Water Fund was used to finance \$508 million, or approximately 8 percent, of the construction expenditures through 2011.

Revenue Bonds

Revenue bond financing is derived from the sale of revenue bonds as authorized by the Central Valley Project Act (California Water Code Sections 11100–11925). DWR's authority to issue revenue bonds was confirmed by a decision of the California Supreme Court in 1963 (*Warne v. Harkness*, 60 Cal. 2d 579).

Proceeds from the sale of revenue bonds are deposited in the Central Valley Water Project Construction Fund, from which money is expended only for purposes specified in the resolution authorizing each bond sale. Those purposes, in addition to paying construction, planning, and right-of-way costs, may include funding the Debt Service Reserve Account, paying interest on bonds, and paying water system operating expenses during a specified period.

As of December 31, 2011, DWR had sold \$8.5 billion of revenue bonds. That amount includes \$4.6 billion of refunded bonds, leaving a total principal obligation of \$3.9 billion.

Capital Resources

Capital resources financing is derived from payments and appropriations (including a portion of the State tideland oil revenues) authorized by a variety of special contracts, cost-sharing agreements, and legislative actions concerning the SWP, plus accrued interest on these funds. Capital resources revenues are deposited in the Central Valley Water Project Construction Fund and may be expended for interest on general obligation bonds and costs of constructing SWP facilities.

According to DWR's financial management policy, the capital resources revenues are used first to cover any general obligation bond debt service that exceeds available revenues.

Capital Financing Sources

Capital financing sources include power revenue bonds, East Branch Enlargement bonds, East Branch Extension bonds, SBA Enlargement bonds, water system facilities bonds, initial project facilities bonds, bond proceeds from the Davis-Grunsky Act Program, California Water Fund monies, and capital resources revenues.

Line 21, Power Facilities Revenue Bonds through Series H, includes the proceeds applied from power revenue bonds for Oroville, Devil Canyon, Castaic, Warne, Reid Gardner, Bottle Rock, Alamo, South Geysers, and small hydro projects.

No future power revenue bond sales are projected for this financial analysis.

Line 22, East Branch Enlargement, Current Bonds, shows that \$474 million of Water System Revenue Bond proceeds has been applied to the East Branch Enlargement project through December 31, 2011. Of this total, \$417 million was used for construction expenditures and \$57 million was used for bond discounts, interest costs, and debt service reserve requirements.

Line 23, East Branch Enlargement, Future Bonds, shows DWR's estimate of \$490 million of bonds required to complete construction of the East Branch Enlargement Phase II.

Line 24, East Branch Extension, Current Bonds, shows that \$193 million of Water System Revenue Bond proceeds has been spent through December 31, 2011.

Line 25, East Branch Extension, Future Bonds, shows DWR's estimate of \$221 million of additional bonds required to complete construction of the East Branch Extension and to pay for bond discounts, capitalized interest, and debt service reserve requirements.

Line 26, South Bay Aqueduct Enlargement, Current Bonds, shows that \$180 million of Water System Revenue Bond proceeds had been spent through December 31, 2011.

Line 27, South Bay Aqueduct Enlargement, Future Bonds, shows DWR's estimate of \$1.3 million of bonds required to complete construction of the SBA Enlargement and to pay for bond discounts, capitalized interest, and debt service reserve requirements.

Line 28, Water System Facilities, Current Bonds, shows that through December 31, 2011, \$1.8 billion of proceeds from Water System Revenue Bonds, Series A through Series AJ, was applied to SWP projects other than the East Branch Enlargement, the East Branch Extension, and the SBA Enlargement. Of this total, \$1.6 billion was used to pay for construction expenditures and \$0.2 billion was used to pay for bond discounts, capitalized interest, and debt service reserve requirements.

Line 29, Water System Facilities, Future Bonds, shows that \$1.0 billion of future water revenue bonds is needed to provide \$917 million for construction of SWP water system facilities and \$95 million for bond discounts, interest costs, and debt service reserve requirements.

Line 30, Subtotal, Water System Revenue Bonds, is the total of Lines 22 through 29.

Line 31, Initial Project Facilities Bond Proceeds, shows the amount of general obligation bonds sold to provide financing costs for initial SWP facilities and for costs of planning certain additional conservation facilities.

Financing initial facilities from general obligation bonds was completed in mid-1972 and totaled \$1.444 billion—\$1.750 billion Burns-Porter Act authorization less \$130 million reserved for the Davis-Grunsky Act Program and \$176 million "offset" for additional conservation facilities. (The Burns-Porter Act provides that to the extent California Water Fund monies are expended, an equal amount of general obligation bonds are reserved [offset] for financing the construction of additional conservation facilities in certain watersheds.)

In mid-1972, the reservation of offset bonds was effectively limited to \$176 million, the total amount of California Water Fund monies expended up to that time. By mid-1972, all general obligation bonds authorized by the Burns-Porter Act had been offset, reserved for the Davis-Grunsky Act Program, or used for SWP construction.

Approximately \$8.5 million of the offset bonds was used to finance planning studies of the Middle Fork Eel River Development. This financial analysis is not based on the use of any offset bond proceeds to meet capital requirements. If, at some time, the State constructs an additional conservation facility, as specified in California Water Code Section 12938, the remaining offset bonds could be sold.

Line 32, Davis-Grunsky Act Program Bond Proceeds, shows, for simplification, the entire \$130 million of capital expenditures authorized for the Davis-Grunsky Act Program, according to the Burns-Porter Act, as being funded by proceeds from the sale of general obligation bonds. In fact, \$102 million originated from bond proceeds while \$28 million from the California Water Fund was used for the program in lieu of bond proceeds prior to 1969. Since the final offset in 1994, DWR has accumulated \$44.6 million in capital costs through fiscal year 2006–2007.

Line 33, Application of California Water Fund Monies, shows the amount of SWP costs financed under the Burns-Porter Act. The act provides that any available money in the California Water Fund must be used for construction in lieu of proceeds from the sale of general obligation bonds.

When the Burns-Porter Act became effective in late 1960, approximately \$97 million had been accumulated in the fund. That balance, plus subsequent appropriations, interest earnings, and other miscellaneous income to the fund through December 31, 2011, was used to finance a total of \$508 million of SWP costs.

Line 34, Interim Financing, shows the net annual amounts of funds flowing into and out of the Water Revenue Commercial Paper Notes program. This program was established in March 1993 to provide an ongoing source of interim financing for water system projects prior to permanent financing from the sale of long-term revenue bonds. DWR has authority to issue up to \$141.5 million of Water Revenue Commercial Paper Notes. A positive number indicates money borrowed from the program to finance construction costs. A negative number indicates money repaid to the program. The financial analysis assumes that all funds borrowed from the program will be repaid before the end of the analysis period.

Line 35, Application of Capital Resources Revenues to Construction, presents the Capital Resources Revenues applied for capital expenditures.

Line 36, Revenue Transfers Applied, shows monies assumed to be transferred to the California Water Fund, according to provisions of the Burns-Porter Act, and subsequently reappropriated to construction (see Line 40 of Table 14-2). Projected amounts for the years 2012 through 2021 include funds to finance expenditures for agricultural drainage facilities, as indicated

in Line 13 of Table 14-1, and expenditures for additional conservation facilities, as indicated in Line 12.

Line 37, Subtotal, Other Capital Financing, is the total of Lines 31 through 36.

Line 38, Total Financing of Capital Requirements, totals Lines 21, 30, and 37.

Annual Revenues and Expenditures

After financial analysis of SWP operations, DWR concluded that projected payments by contractors and other revenues will be adequate to pay annual operations, maintenance, power, and replacement costs and meet all repayment obligations on funds used to finance SWP construction and other authorized costs during the period 2012 through 2021. Data on annual revenues and expenditures are presented in Table 14-2. A detailed discussion of each line item follows.

Project Revenues

Project revenues primarily consist of SWP water contractor payments required under their individual long-term water supply contracts. Those revenues are deposited in two funds: the Central Valley Water Project Revenue Fund, where all revenues pledged to revenue bonds are placed, and the California Water Resources Development Bond Fund—Systems Revenue Account, where all other SWP operating revenues are placed. Use of those funds is limited to paying operating costs and debt service; except that revenues in excess of those costs may be deposited to a reserve for future SWP construction, since the California Water Fund has been repaid (see Line 39).

Line 1, Capital Resources Revenues, includes the following:

- federal payments for SWP capital expenditures;

- appropriations for capital costs allocated to recreation;
- appropriations for SWP capital expenditures prior to passage of the Burns-Porter Act and according to Senate Bill 261 (1968);
- payments from Los Angeles Department of Water and Power for Castaic power development;
- advances from contractors for construction of requested work;
- investment earnings on the Capital Resources Account; and
- investment earnings on unexpended revenue bond proceeds.

Historically, appropriations for capital costs allocated to recreation and fish and wildlife enhancement have amounted to \$5 million per year and have been appropriated by the California Legislature from the State tideland oil revenues. There have been no appropriations since 1985, and no appropriations are indicated in the financial analysis for 2012 through 2021. Legislation enacted in 1989 offset a portion of the amount owed to the SWP by the State for costs allocated to recreation and fish and wildlife enhancement against the amount the SWP owed to the California Water Fund (see Line 39). Since the final offset in 1994, DWR has accumulated \$67.2 million in capital costs through fiscal year 2011–2012.

Lines 2 through 12, Water Contractor Payments, show amounts of the separate elements of water contractor payments.

Amounts in Line 4 also include revenues sufficient to cover costs associated with sales of excess power. Appendix B of this bulletin presents a detailed explanation of payments identified in Lines 2 through 12.

Operations, maintenance, power, and replacement (OMP&R) costs are repaid as they are incurred as part of the Transportation Charge; therefore, no interest

charges are included. Construction costs included in the Transportation Charge, and all construction and annual OMP&R costs included in the Delta Water Charge, are to be repaid with interest at the Project Interest Rate.

The Project Interest Rate, as defined in Article 1(r) of the standard provisions of the long-term water supply contracts, is the weighted average of the rates paid on certain securities issued and loans obtained to finance SWP facilities.

According to the original water supply contract provisions, the basis for determining the Project Interest Rate was the weighted average of rates paid on general obligation bond sales only. In 1969, after Oroville Revenue Bonds were issued, the contracts were amended to expand the basis to include rates on all other securities sold and loans obtained thereafter for financing SWP facilities, including revenue bonds (see Bulletin 132-70, page 28).

However, not all proceeds from the sale of revenue bonds are melded into the calculation of the Project Interest Rate. Only those proceeds applied to construction costs (the only application of general obligation bonds permitted by law) and those consumed by the bond discount (a component of the total interest cost of a revenue bond issue) are included in the calculation (see Table 14-8).

Calculations for determining the Project Interest Rate do not include proceeds from the sale of revenue bonds for Off-Aqueduct Power facilities, the East Branch Enlargement facilities, SBA, or water system facilities defined in the Water Revenue Bond Amendment. Table 14-9 lists all bond sales by date and presents basic information used in the calculation of the Project Interest Rate.

Information about contractor water charges in Appendix B, which can be found in the

Table 14-8 Revenue Bond Proceeds Affecting Project Interest Rate (in millions of dollars)

Project	Proceeds Included in Project Interest Rate				Total Principal Amount of Bonds	Percentage of Total Amount Included in Calculating Project Interest Rate [4] / [5]
	Applied to Construction Costs	Less Portion of Proceeds Derived from Interest Earnings Prior to Delivery of Bonds	Plus Bond Financing and Refunding Costs	Subtotal, Proceeds Included in Calculating Project Interest Rate [1] - [2] + [3]

^a Amount consists of 71 percent of proceeds deposited in escrow to refund portion of Series D bonds (\$35.1 million plus deposits to construction account [\$0.3 million]).

^b Represents amount of principal used to refund portions of prior bond issuances.

back of this bulletin, is based on known conditions and substantiates DWR's determination of 2013 water charges to be billed on July 1, 2012. However, information about significant differences between the sum of future charges included in Lines 2 through 12 of Table 14-2 and the substantiation of 2013 charges included in Appendix B are as follows.

- Future capital costs in Appendix B are based on the prevailing prices as of December 31, 2011. Those costs presented in the financial analysis include allowances for price escalation.
- Pre-2012 charges in Appendix B represent charges as they should have been, according to currently known conditions. Pre-2012 charges included in Table 14-2 are those actually paid as part of previously determined bills.
- Charges in Appendix B are unadjusted for past overpayments or underpayments. Charges included in Table 14-2 for 2012 and thereafter have been adjusted for any apparent overpayments or underpayments of pre-2012 charges.
- Charges in Appendix B for East Branch Enlargement costs include the amounts for debt service and 25 percent cover for the East Branch Enlargement share of the Series A through Series AJ bonds. Charges in Table 14-2 apply to Series A through Series AJ bonds and also include amounts of the debt service and cover for assumed future bonds.
- The water revenue bond surcharge in Appendix B applies only to the Series B through Series AJ bonds. Surcharge values included in Table 14-2 apply to Series B through Series AJ bonds and to assumed future issues required to finance SWP construction costs included in Table 14-1.

Line 13, Subtotal, Water Contractor Payments, is the total of Lines 2 through 12.

Line 14, Revenue Bond Cover Adjustments, represents the credit to contractors resulting from the cover of 25 percent of the annual debt service for Power Facilities Revenue Bonds and Water System Revenue Bonds. Cover is collected as required by the bond resolutions to provide security to the bondholders. If not needed to meet annual bond service, the cover is credited to the contractors in the following year. The annual charges for the following cost components include an amount for bond cover:

- minimum OMP&R component of the Transportation Charge for Off-Aqueduct Power Facilities;
- Water System Revenue Bond Surcharge;
- capital cost component of the Transportation Charge for East Branch Enlargement Facilities;
- capital cost component of the Transportation Charge for Coastal Branch Extension Facilities;
- capital cost component of the Transportation Charge for East Branch Extension Facilities;
- capital cost component of the Transportation Charge for Tehachapi Afterbay; and
- capital cost component of the Transportation Charge for SBA Enlargement.

Line 15, Rate Management Adjustments, shows the projected amount of revenue reductions allocated to contractors after repayment of the California Water Fund (see Line 39). Under provisions of the Monterey Amendment, the reduction amount allocated to agricultural contractors is deposited into a trust fund to stabilize payments in water-short years. The urban contractor allocation is applied as a direct reduction in charges.

Line 16, Federal Payments for Project Operating Costs, shows federal payments made in accordance with the December 31, 1961, agreement between California and

Table 14-9 Actual Bond Sales and Project Interest Rates, by Date of Sale

Portion allocated to Project Interest Rate		63,903,487	2,945,789	4.610	4.610

^a A unit equivalent to one dollar of principal amount outstanding for one year.

^b The total interest cost (without regard to discounts paid or to premiums received) divided by the total dollar-years, expressed as a percent.

^c Determined by dividing cumulative interest costs by cumulative dollar-years, expressed as a percent. (Excluding Oroville Division bonds and revenue bonds for Off-Aqueduct Power Facilities, East Branch Enlargement Facilities, East Branch Extension Facilities, Water System Facilities as defined in the Water Revenue Bond Amendment, Coastal Extension Facilities, or South Bay Aqueduct Enlargement Facilities.)

the United States providing for DWR to operate and maintain the San Luis Joint-Use Facilities. According to the January 12, 1972, supplement to the agreement, the Bureau of Reclamation (Reclamation) initially paid 45 percent of operations, maintenance, and replacement (OM&R) costs for those activities. (The percentage does not apply to power costs; Reclamation and DWR each provide their own power to pump water through the joint facilities.)

The percentage paid by Reclamation is periodically reviewed by Reclamation and DWR. The most recent review of the percentage paid by Reclamation was completed in 1987 and resulted in a federal share of 44.09 percent. The amounts in Line 16 are based on the assumption that the federal share will continue at this level for calendar years 2012 through 2021.

Line 17, Appropriations for Operating Costs Allocated to Recreation, shows appropriations made under the Davis-Dolwig Act. In passing the Davis-Dolwig Act, the California Legislature declared its intent that, except for funds provided according to Assembly Bill 12 (1966), DWR's budget will include appropriations of monies from the General Fund necessary for enhancement of fish and wildlife and recreation in connection with State water projects.

Annual OMP&R costs allocated to recreation and fish and wildlife enhancement are to be paid by annual appropriations from the General Fund. Through fiscal year 1982–1983, these appropriations totaled \$16.657 million. There have been no additional appropriations since the 1982–1983 fiscal year and none are indicated for 2012 through 2021.

Legislation enacted in 1989 offset a portion of the amount owed to the SWP by the State for costs allocated to recreation and to fish and wildlife enhancement against the amount the SWP owed to the California

Water Fund (see line 39). Since the final offset in 1994, DWR has accumulated \$199.3 million in OMP&R costs through fiscal year 2011–2012.

Line 18, Davis-Grunsky Loan Repayments, shows the repayments by local agencies of \$69.3 million of loans disbursed as of December 31, 2011. Repayment on any future loans was assumed to be beyond the period covered by the financial analysis.

Line 19, Revenue Bond Proceeds, includes bond proceeds classified as special reserves according to the description of revenue bond financing in Line 17 of Table 14-1. Those proceeds, used for capitalized OMP&R costs, revenue bond debt service, and debt service reserves, are not classified as revenue but are included in this line to simplify the financial presentation.

Line 20, Interest Earnings on Operating Revenues, includes interest earnings on unexpended proceeds from the sale of general obligation bonds, interest on operating reserves, and other short-term investment earnings on SWP revenues.

Line 21, Oroville-Thermalito Payments, shows payments from Pacific Gas & Electric Company, Southern California Edison, and San Diego Gas & Electric Company for power generation at the Oroville facilities. Those utilities purchased all power generation from Hyatt and Thermalito powerplants before April 1, 1983, in accordance with a power sale contract dated November 29, 1967. The historic amount includes the amounts of final settlement of payments made according to the contract.

Line 22, Miscellaneous Revenues, includes all other operating revenues not included in Lines 2 through 21.

Line 23, Subtotal, Other Revenues, is the total of Lines 16 through 22.

Line 24, Total Operating Revenues, is the total of Lines 13, 14, 15, and 23.

Line 25, Total Operating Revenues and Capital Resources Revenues, is the total of Lines 1 and 24.

Project Expenses

Project expenses include the following:

- operations, maintenance, and power costs;
- deposits to replacement reserves;
- deposits to special reserves;
- capital resources expenditures; and
- debt service.

Revenue bond proceeds earmarked for debt service during construction and the first year's operating expenses are deposited in the Central Valley Water Project Construction Fund and disbursed in accordance with resolutions authorizing the issuance of such bonds.

Water contractor revenues associated with operating costs and debt service attributable to projects financed by revenue bonds are deposited in the Central Valley Water Project Revenue Fund for appropriate disbursement. All other operating revenues are deposited in the California Water Resources Development Bond Fund—Systems Revenue Account and are disbursed in accordance with the following four priorities of use, as specified in the Burns-Porter Act:

- SWP OMP&R costs;
- general obligation bond debt service;
- repayment of expenditures from the California Water Fund; and
- deposits to a reserve for future SWP construction.

Project expenses are presented in Lines 26 through 36 of Table 14-2.

Line 26, Project Operations, Maintenance, Power, and Replacement Costs, shows the OMP&R portion of the historical and projected costs presented in Table 14-10.

Table 14-10 and Line 26 of Table 14-2 also include the amounts of the operations and maintenance costs for the federal share of joint facilities and those OMP&R costs allocated to recreation, which are intended to be offset by revenues listed in Lines 16 and 17.

Allowances for cost escalations are included in OMP&R costs through 2012. Allowances for additional long-term price escalations in the future are not included in these estimates, because changes in OMP&R costs do not substantially affect the overall results of the financial analysis. (For the most part, changes in OMP&R costs cause direct offsetting changes in operating revenues.)

Power costs make up the largest component of annual operating expenses for the SWP. Assumptions about future power sources and costs are discussed in Chapter 10, Power Resources. Line 26 also includes costs associated with power transactions that result in the sale of power not required for the delivery of water.

Line 27, Deposits to Replacement Reserves, shows funds set aside as required by contract for replacing existing SWP facilities. By December 31, 2011, \$139.2 million had been spent for replacement costs; the balance of the replacement reserve as of that date was \$30.1 million.

Line 28, Deposits to Special Reserves Under Revenue Bond Financing, includes two significant components: special reserve deposits related to revenue bonds and capital resources revenue carryover from prior years used for construction in the current year. Special reserve deposits are the

net of several income and expenditure items. Income items related to revenue bonds are:

- proceeds set aside to pay bond interest during construction (capitalized interest);
- proceeds set aside for first year operating costs (capitalized operations and maintenance);
- water contractor payments or bond proceeds set aside for debt service reserves;
- water contractor payments for revenue bond cover requirements; and
- deposits to and withdrawals from operating reserves to meet day-to-day cash flow requirements.

The 1952–2011 column also includes advances to DWR’s revolving fund for working funds to purchase mobile equipment and to meet day-to-day operating expenses.

The expenditure items related to revenue bonds include:

- debt service cover payments returned to contractors;
- debt service reserve interest payments returned to contractors;
- surplus account funds returned to contractors or applied to meet expenses;
- total capitalized interest paid out; and
- total capitalized operations and maintenance paid out.

Special reserves, reduced over time as reserved amounts, are used for their respective purposes. The amount indicated each year in Line 28 reflects the change from the previous year. A negative number indicates a withdrawal of special reserves to meet expenses, while a positive number indicates a deposit.

Line 29, Capital Resources Expenditures, includes the amount of capital resources revenues applied to construction that is shown in Line 35 of Table 14-1. In

Table 14-2, these expenditures are funded out of withdrawals from the reserves in Line 28 and do not affect net revenues shown in Line 38.

Lines 30 and 31, Payment of Debt Service on Bonds Sold through December 31, 2011, show the total principal and interest payments, respectively, on bonds sold to date. Table 14-11, at the end of this chapter, summarizes payments on general obligation bonds (Series A through Y water bonds), power revenue bonds by project, and water system revenue bonds (Series A through AJ).

Lines 32 and 33, Payments on Projected Future Water Bonds, include the projected annual debt service amounts for future water revenue bonds included on Lines 23, 25, 27, and 29 of Table 14-1 for the East Branch Enlargement, East Branch Extension, SBA Enlargement, and other water system facilities. Assumptions about the service on these future bonds are that interest costs for the water revenue bonds average 4.0 percent; and that bonds are to be repaid by the end of the project repayment period (2035) or sooner, with maturities commencing in the year following the date of sale and with equal annual bond service for the principal repayment period.

Lines 34 and 35, Total Payments of Bond Debt Service, show the total of principal payments indicated on Lines 30 and 32, and the total of interest repayments indicated on Lines 31 and 33.

Line 36, Subtotal, Debt Service, is the total of Lines 34 and 35.

Line 37, Total Operating Expenses and Debt Service, is the total of Lines 26, 27, 28, 29, and 36.

Line 38, Net System Revenues, shows the annual amounts of revenues remaining after the payment of operating costs and bond debt service costs.

Line 39, *California Water Fund Repayment*, shows the total amount of repayments made to the California Water Fund to reimburse the fund for monies expended for construction of the State Water Resources Development System.

Repayment of the California Water Fund was completed in 1998. The \$508 million includes the \$306 million of repayments shown in Line 39 and the \$202 million of reimbursement that was credited to the SWP as offsets for recreation and fish and wildlife enhancement expenditures.

Line 40, *Revenues Used for Capital Expenditures*, includes the amounts required annually for financing scheduled capital expenditures. Revenues not needed for operating costs or debt services are available for financing SWP capital expenditures.

Future Costs of Water Service

Estimates of future water costs are useful to contractors for short-range and long-range planning of water needs, operations, and budgets. Unit water charges shown in Table 14-12 represent estimated costs of water delivery by service area for calendar years 2013 and 2018. The unit rates include costs of existing and future SWP facilities accounted for in Table 14-1 and Table 14-7. The unit water charges are based on the assumption that in 2013 and 2018, the SWP will be able to deliver the entire amount of water requested by each contractor. The unit water charges included in Table 14-12 are listed both as 2013 dollars and as escalated rates reflecting assumed future inflation of 2.5 percent per year through 2018.

Table 14-12 Estimated Unit Water Charges for 2013 and 2018, by Service Area (in dollars per acre-foot)

Service Area and Charge	2013	2018
	(in 2013 dollars)	(in 2018 dollars)

Chapter 15

SWP Education and Information

Albert and Einstein, DWR's two water safety mascots, were created to educate kids of all ages about how to stay water safe at State Water Project facilities.

Significant Events in 2011

In 2011, California received heavy rains and near-record snowfalls in a wet water year that replenished reservoirs and provided an abundant water supply. The State Water Project (SWP) provided 80 percent of its contractors' water deliveries during 2011, up by 30 percent from the 50 percent deliveries in 2010.

Recognizing the end of a 3-year drought, Governor Edmund G. Brown Jr., in March formally rescinded Governor Schwarzenegger's drought emergency declaration of 2008–2009. However, because of yearly variations in water availability, water officials stressed conservation. "California can quickly turn from wet to dry," reminded DWR Director Mark W. Cowin, "and we can't afford to forget the lessons of conservation that we learned in the 2007–2009 drought."

For its long-term water planning, DWR hosted a 2-day meeting in Sacramento in October to advance the process of preparing the *California Water Plan Update 2013*. In preparing this comprehensive report on California's water supply and demand, DWR relies on extensive input from water experts and the public. The California Water Plan updates are published at 5-year intervals.

Information for this chapter was provided by the Public Affairs Office.

The Department of Water Resources (DWR) Public Affairs Office (PAO) produces and distributes news and program information describing California's water resources, DWR, its mission, programs, and activities. PAO disseminates information by way of news releases, interviews, Internet posts, and publications. Other avenues include artwork, films, graphics, photography, public meetings, social media, and special events.

News Topics

Selected highlights below provide examples of PAO's 2011 outreach efforts related to DWR's water policy, programs, and activities.

Snow Surveys

DWR experts conduct five monthly Sierra snow surveys, ending in late April or early May, when snowpack typically is at its peak. By analyzing snow depth and water content, experts gauge the Sierra snowpack's potential for producing snowmelt runoff for water use. Typically, Sierra snowpack produces about one-third of California's annual water supply.

DWR promotes media coverage of its monthly snow surveys to help inform water agency managers and educate the public about snowpack conditions and water supply prospects. In 2011, the monthly surveys received extensive coverage because heavy precipitation produced an increased estimate of water availability. The Sierra snowpack improved after the relatively dry years of 2007, 2008, and 2009.

Winter precipitation started at 195 percent of average for December. Though January was relatively light, succeeding months resumed a wet and snowy pattern that enabled DWR to gradually boost its State Water Project (SWP) supply projections as the season progressed. DWR's final snow survey showed that snowpack water content statewide was at 144 percent of the April 1 full season average.

SWP Allocations

DWR's first estimate for 2011 was that it could deliver 25 percent of requests. That estimate rose to 50 percent with the December snowstorms. After the final snow survey data was analyzed, DWR announced it would deliver 80 percent of requested SWP water in 2011.

In 2010, the SWP delivered 50 percent of water contractors' requests. In the three prior dry years, SWP deliveries were 60 percent in 2007, 35 percent in 2008, and 40 percent in 2009.

Climate Change

Climate change topics are key elements in preparation of the *California Water Plan Update 2013*. An initial meeting to launch research and expert input for this report was held in October.

In December, DWR joined with other leading water agencies, including the U.S. Environmental Protection Agency and the U.S. Army Corps of Engineers, to publish the *Climate Change Handbook for Regional Water Planning*. The handbook provides guidance and technical advice for water managers dealing with the impacts of climate change. DWR also presented a climate change exhibit in Long Beach in October.

SWP Publications

DWR maintains approximately 40 brochures describing the SWP, its mission, and facilities. The brochures are periodically issued in updated versions and distributed statewide to educate the public about the SWP.

E-News

PAO compiles and electronically distributes news articles and commentaries on water related issues. These news clips inform DWR managers and staff of water issues relevant to DWR and its programs.

DWR—A Magazine from DWR

This magazine (formerly *DWR News/People*) contains articles highlighting DWR programs and employees. The magazine is available in electronic and hardcopy format.

In the Winter 2010–2011 issue, the magazine profiled DWR's Delta Field Division, which includes the SWP's Banks Pumping Plant and the northernmost stretch of the California Aqueduct. Another major feature described the growth and functions of the Solano County Water Agency, an SWP long-term contractor that is served by the North Bay Aqueduct. Other stories described research efforts by DWR's consulting firm, RNT Consulting, Inc., to help safeguard the SWP from invasive mussels, and DWR's role in a multiagency effort to restore flows and fish populations to the San Joaquin River, California's second-longest river.

In the Spring/Summer 2011 issue, the magazine focused on the 10-year anniversary of DWR's California Energy Resources Scheduling Division, created to help solve a 2001 electrical energy crisis and prevent a statewide blackout. This edition also featured an article entitled *The Rains Have Come Back*, in which veteran DWR hydrologist Maury Roos analyzed California's water supply recovery in water year 2011.

Another story profiled DWR's Oroville Field Division, home of Oroville Dam, the tallest earth-filled dam in the nation, and Lake Oroville, the largest storage reservoir in the SWP. The cover story reported on the progress of the East Branch Extension of the California Aqueduct.

The Fall 2011 issue featured an article about DWR's Southern Region Office, part of the Division of Integrated Regional Water Management. The Fall issue also profiled the Santa Clara Valley Water District, and the Save Our Water program, which won two awards in 2011, one from the National Association of Government Communicators and one from the International Association of Business Communicators.

DWR Tours Program

During 2011, DWR welcomed 22 foreign tours with 182 visitors to DWR's Headquarters and SWP facilities. Tour groups came from throughout the United States and 16 foreign countries, including Canada, Chile, China, Egypt, Israel, Japan, Macedonia, the Netherlands, Russia, and South Korea.

There were also a number of domestic and school tours as follows:

- Oroville Field Division hosted 82 groups with 1,848 participants;
- Delta Field Division had 21 bus tours;
- Romero Overlook Visitors Center hosted 47 tour groups (16 foreign) with 1,414 participants;
- San Joaquin Field Division had one bus tour at the facilities;
- Southern Region Office hosted 15 tour groups with 173 participants; and
- Vista del Lago Visitors Center welcomed 24 tour groups (6 foreign) totaling 763 participants.

In addition, there were seven employee and nine nonemployee van tours of the Delta and Oroville field divisions. Figure 15-1 shows the SWP visitors center locations.

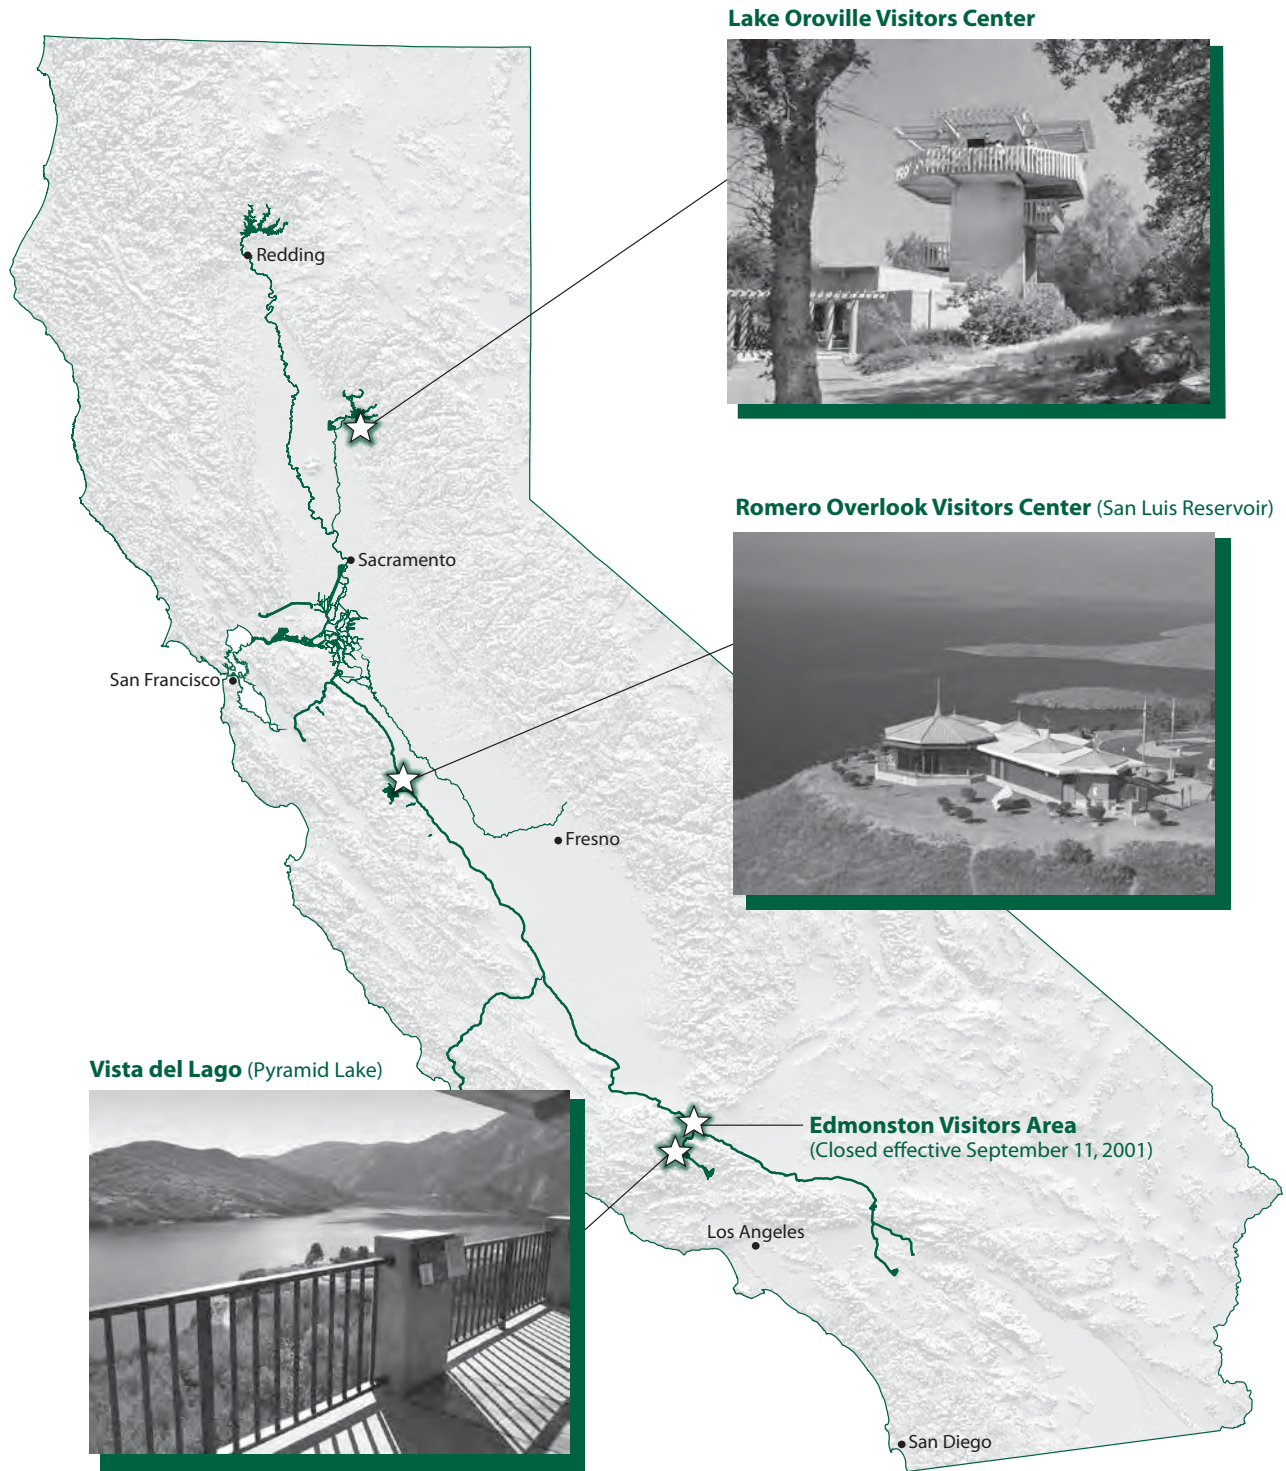

Figure 15-1 Visitors Centers on the SWP

Community Relations and Recreational Safety

PAO staff continued to educate the public about water conservation and the Save Our Water program through DWR's award-winning water efficient gardens at the California State Fair, and with an exhibit at the Tamale Festival in Indio County. Other Save Our Water outreach that PAO staff assisted with included booths at the Alameda County Fair and the Cornflower Farms Open House event in Elk Grove. Additionally, DWR worked with Radio Disney for the third year to educate younger Californians about water conservation via public service announcements and at Northern California regional events.

Using many ways to develop relationships with various communities through water recreation, education, conservation, and safety, PAO administers the annual Lakes and Reservoirs Appreciation Week in the summer. Lakes and Reservoirs Appreciation Week was held July 1–7, 2011. This event promotes clean, safe, and nonpolluting forms of recreation at lakes and reservoirs, including those in the SWP system.

DWR also co-sponsors and coordinates "Catch A Special Thrill" (C.A.S.T.) fishing events for disabled and disadvantaged children. During 2011, C.A.S.T. events were held at Lake Oroville, Lake del Valle, Castaic Lake, Silverwood Lake, and Lake Perris.

DWR continued its partnerships with communities to offer nine Aquatic Adventure Camps throughout the summer months, teaching water safety to children, especially those who would most benefit from positive youth development. The camps utilized facilities at Lake Oroville, Lake del Valle, Castaic Lake, and Lake Perris.

SWP Recreation Outreach Program

The goal of the SWP recreation outreach program is to educate the public about the many recreational opportunities available at SWP facilities. PAO staff attends community events, State and county fairs, State and federally sponsored events, and forms partnerships with State, federal, and community groups.

SWP Recreation Outreach Events

DWR, the California Department of Parks and Recreation, and several partner agencies co-sponsored or attended the following recreation outreach events in 2011:

- Sacramento International Sportsmen's Exposition, Sacramento;
- North State Sportsman Expo, Chico;
- Jack Splash Club/Oroville YMCA Healthy Kids Day/Kiwanis Egg Hunt, Oroville;
- Oroville Feather Fiesta Days, Oroville;
- Fit-N-Fun Day, Oroville;
- O'Neill Forebay Fun & Fishing Day for Kids, Gustine;
- Oroville Hooked on Fishing Not Drugs, Oroville;
- C.A.S.T. New Melones Lake, Sonora;
- C.A.S.T. Lake Oroville, Oroville;
- C.A.S.T. Lake del Valle, Livermore;
- Butte County Fair Sportsmen's Expo, Gridley;
- Pittsburg Seafood Festival, Pittsburg;
- Save the Auburn Ravine Salmon and Steelhead Festival, Lincoln;
- Feather River Salmon Festival, Oroville;
- El Dorado Sportsman's and Outdoor Expo, Placerville; and
- Stanislaus River Salmon Festival, Knight's Ferry.

The Jack Splash Club was created by PAO as a way to interest and educate kids and their families in the Oroville area about safe water recreation. The Oroville YMCA helped manage the club because of its

water safety programs, fitness programs, and community standing.

SWP Recreation Outreach Publications

The following recreation outreach publications were made available to the public:

- *Family Getaway Map*
- *Family Getaway Guide*
- *Lake Oroville Recreation*
- *Best Bass Fishing Lake*
- *Lake Oroville Floating Campsite*
- *Upper Feather River Lakes*
- *South Bay Aqueduct/Lake del Valle/Bethany Reservoir*
- *San Luis Joint-Use Complex*
- *Quail Lake*
- *Pyramid Lake*
- *Castaic Lake*
- *Lake Perris*
- *Silverwood Lake*
- *Fishing along the State Water Project*
- *State Water Project Recreation Facilities*
- *Water Safety along the SWP*
- *Quagga Warning Card*
- *Quagga Info Sheet*

The *Family Getaway Map* and *Family Getaway Guide* were developed to expand the public's awareness of the waters of California, including rivers, lakes, and reservoirs.

School Education Program

The School Education Program's goal is to provide students and educators with a statewide perspective on water issues such as conservation, conveyance systems, and the water cycle. PAO staff develops and promotes high-quality materials, providing them free of charge to schools, educators, and water districts.

Public Events and Outreach

PAO staff provided displays of DWR's interactive children's exhibits and other educational materials at:

- the Sacramento Municipal Utility District's Youth Energy Summit, Sacramento;
- AgVenture, San Joaquin County;
- the Children's Water Education Festival, Yorba Linda;
- the Sacramento Area Creeks Council's Creek Week Event, Sacramento;
- the CalEPA Earth Day Event, Sacramento;
- State Scientists' Day, Sacramento; and
- the Lindsay Wildlife Museum's Educator Resource Fair, Walnut Creek.

PAO staff organized a team of DWR judges from multiple divisions and provided a special award at the Sacramento Regional Science and Engineering Fair in Sacramento.

Publications and Materials

Curriculum materials and children's videos were provided to California teachers and water agencies through the *Water Facts & Fun* online catalog and order form, and during promotional events. During 2011, the following materials were purchased or reprinted:

- 10,000 *California Water Works & Why It Does* student booklets;
- 3,000 *Captain Hydro* student workbooks;
- 4,750 California Environmental Education Interagency Network resource brochures;
- 325 *Conservation Connection* student books;
- 325 *Conservation Connection* teacher guides;
- 5,000 *KIDS: Discover Storm Water* student activity booklets;
- 7,500 hamburger activity sheets for students;

- 4,000 parent/student water conservation checklists;
- 8,000 *Water & Me* student activity booklets;
- 7,500 water conservation pledge sheets; and
- 380 *Project WET* (Water Education for Teachers) books, which were provided to pre-service teachers who participated in Project WET training workshops.
- Delta Studies Institute for teachers, co-sponsored with the San Joaquin County Office of Education.

Collaboration and Partnerships

DWR's School Education Program seeks to partner with other entities with similar interests and goals to pool resources in educating California's youth on the importance of water resources. During 2011, PAO staff participated in the following collaborative activities/meetings:

- Project WET Advisory Committee, the California Environmental Education Interagency Network Committee,
- California Urban Water Conservation Council's Education subcommittee and the Northern California Water Educators Collaborative;
- Creek Week Planning Committee, where activity passports, artwork for a poster, brochures, and a Creek Week Celebration bookmark were provided; and
- Caring for Our Watersheds contest, sponsored by Agrium and the Center for Land-Based Learning.

Additional collaborative efforts included PAO staff working with the following:

- California Department of Education's California Regional Environmental Education Community Network;
- California Environmental Education Foundation Teacher Institute;
- Floodplain and Delta Ecology Institute for teachers, co-sponsored with the San Joaquin County Office of Education; and

Glossary

This glossary contains terms used in the text of Bulletin 132-12 as well as additional terms related to water resources.

A

abundance The number of organisms of a particular kind in a population. (See also, abundance index.)

abundance index (fisheries) A relative measure of the weight or number of fish in a stock, a segment of the stock (e.g. the spawners), or an area. Often available in time series, the information is collected through scientific surveys or inferred from fishery data.

acre-foot The volume of water that would cover one acre to a depth of one foot; equal to 43,560 cubic feet or 325,851 gallons.

adaptive management The process of improving management effectiveness by learning from the results of carefully designed decisions or experiments.

adipose fin A small fleshy fin with no rays on the topside of a fish located between the fin on the back and the tail fin.

afterbay A storage reservoir downstream of a power plant or large reservoir that regulates fluctuating discharges from a hydroelectric power plant or a pumping plant.

agricultural drainage (1) The process of directing excess water away from root zones by natural or artificial means, such as by using a system of drains placed below ground surface level; also called subsurface drainage; (2) the water drained away from irrigated farmland.

alluvium Unconsolidated soil strata deposited over time by flowing water.

amphipod A small crustacean with a flat (laterally compressed) body belonging to the group Amphipoda, found in freshwater or marine environments.

amphipod A small crustacean with a flat (laterally compressed) body belonging to the group Amphipoda, found in freshwater or marine environments.

anadromous Fish that live the majority of their life cycle in the sea and return to freshwater streams to spawn.

anion An atom or a molecule in which the total number of electrons is greater than the total number of protons, giving it a net negative electrical charge.

aquifer A geologic formation that stores water underground (called groundwater), especially one that yields significant quantities of water to wells or springs.

arid Describes a climate or region in which precipitation is so deficient in quantity or occurs so infrequently that intensive agricultural production is not possible without irrigation.

artificial recharge The addition of surface water to a groundwater basin by human activity, such as putting surface water into spreading basins.

average annual runoff The average value of annual runoff volume calculated for a selected period of record, at a specified location, such as a dam or stream gauge.

average year water demand Demand for water under average hydrologic conditions for a defined level of development.

B

balanced water conditions These exist when upstream reservoir storage releases, plus other inflows, approximately equal the water supply needed to (1) satisfy Sacramento Valley and Sacramento-San Joaquin Delta in-basin needs, including Delta water quality requirements, and (2) meet export needs. DWR and Reclamation jointly decide when balanced or excess water conditions exist.

beneficial use Water quality beneficial use categories for water are designated by State law. Beneficial uses of the waters of the State that may be protected against water quality degradation include, but are not limited to, domestic, municipal, agricultural, and industrial supply; power generation; recreation; aesthetic enjoyment; navigation; and preservation and enhancement of fish, wildlife, and other aquatic resources or preserves.

benthic organisms Aquatic animals without backbones that dwell on or in the bottom sediments of fresh or salt water.

biological assessment A document prepared as part of the Endangered Species Act, Section 7 process to determine whether a proposed major construction activity under the authority of a federal action agency is likely to adversely affect listed species, proposed species, or designated critical habitat.

biological opinion A document required by the Endangered Species Act stating the opinion of the U.S. Fish and Wildlife Service or National Marine Fisheries Service on whether or not a federal action is likely to jeopardize the continued existence of listed species or result in the destruction or adverse modification of critical habitat.

biota Living organisms of a region, as in a stream or other body of water.

brackish water Water containing dissolved minerals in amounts that exceed normally acceptable standards for municipal, domestic, and irrigation uses. Considerably less saline than sea water.

bromide A salt which naturally occurs in small quantities in sea water; a compound of bromine.

Burns-Porter Act (California Water Code Section 12930 et seq.) Formally known as the California Water Resources Development Bond Act, this act passed the Legislature in 1959 and was approved by voters in 1960. It provided initial funding of \$1.75 billion in general obligation bonds and authorized construction of the State Water Project facilities.

bypass As part of a flood management system, a natural overflow area or channel that allows excessive floodwaters to flow or be diverted from a main river channel to prevent water from overflowing the main river channel.

C

CALFED Bay-Delta Program A federal and State multiagency program the goals of which are to develop and implement a long-term comprehensive plan that will restore ecological health and improve water management in the Bay-Delta system.

California Data Exchange Center (CDEC) CDEC installs, maintains, and operates an extensive hydrologic data collection network including automatic snow reporting gauges for the DWR Cooperative Snow Surveys Program and precipitation and river stage sensors for flood forecasting. CDEC provides a centralized location to store and process real-time hydrologic information gathered cooperatively throughout the State.

California Irrigation Management Information System (CIMIS) A network of automated weather stations that are owned and operated cooperatively between the DWR and local agencies. The stations are installed in most of the agricultural and urban areas of the State and provide farm and large landscape irrigation managers and researchers with “real-time” weather data to estimate crop and landscape evapotranspiration rates and make irrigation management decisions.

California Water Resources Simulation Model (CALSIM) A computer model that simulates operations of the SWP and CVP water delivery systems. CALSIM II is a planning tool that was jointly developed by DWR and Reclamation. The model's inputs include hydrologic data for specified study planning years, water demands, infrastructure and regulatory change, and other factors. Outputs include deliveries to water contractors, river flows, reservoir changes, Delta hydrologic parameters, and other data.

cation An atom or a molecule in which the total number of protons is greater than the total number of electrons, giving it a net positive electrical charge.

Central Valley Project deliveries The volume of water imported to a given area through the Central Valley Project.

ciliates Single-celled organisms, characterized by the presence of many hair-like structures called cilia used for locomotion and for feeding.

climate change Any significant change in the measures of climate lasting for an extended period of time. This includes major changes in temperature, precipitation, or wind patterns, among others, that occur over several decades or longer.

coded wire tag A small piece of stainless steel wire injected into the snout of juvenile salmon and steelhead. Each tag is etched with a binary code that identifies a fish release group.

conjunctive use Application of surface and groundwater to meet the demand for a beneficial use. Coordinated and planned management of both surface and groundwater resources in order to maximize the efficient use of the resource; that is, the planned and managed operation of a groundwater basin and a surface water storage system combined through a coordinated conveyance infrastructure. Water is stored in the groundwater basin for later planned use by intentionally recharging the basin during years of above-average surface water supply.

conservation facilities Reservoir facilities which store water and make it available for later use.

consultation The process required of a federal agency under Section 7 of the Endangered Species Act when any activity authorized, carried out, or conducted by that agency may affect a listed species or designated critical habitat; consultation is with the U.S. Fish and Wildlife Service or National Marine Fisheries Service and may be either informal or formal.

conveyance Provides for the movement of water and includes the use of natural watercourses and constructed facilities including open channels, pipelines, diversions, fish screens, distribution systems, and pump lifts.

conveyance facilities Canals, pipelines, pump lifts, ditches, etc., used to move water from one area to another.

cryptomonad A single-celled, photosynthetic organism with two flagella that inhabits both marine and freshwater environments.

cyanobacteria Photosynthetic, nitrogen-fixing, colonial bacteria found in a wide variety of terrestrial and aquatic habitats, often referred to as “blue-green algae.”

D

Davis-Grunsky Act Authorized in 1960 as part of the Burns-Porter Act, this act provides construction loans for local domestic water projects and agricultural water conservation projects.

Decision 1485 operating criteria The standards for operating the CVP and SWP under Water Right Decision 1485 for the Sacramento-San Joaquin Delta and Suisun Marsh, adopted by the State Water Resources Control Board in August 1978.

Delta outflow Freshwater outflow from the Sacramento-San Joaquin Delta to protect the beneficial uses within the Delta from the incursion of saline water.

Delta outflow index A calculated approximation of the seaward freshwater outflow as it passes Chipps Island near Pittsburg, beyond the confluence of the Sacramento and San Joaquin rivers.

desalting A process to reduce the salt concentration of sea water or brackish water.

diatom Microscopic marine or freshwater colonial algae which have cell walls made out of silica.

dinoflagellate A small single-celled organism with flagella and an internal skeleton of cellulose-like plates, found in both freshwater and marine environments and best known as causers of harmful algal blooms.

discount rate The interest rate used to calculate the present value of future benefits and future costs or to convert benefits and costs to a common time basis.

dissolved organic compounds Carbon-based substances dissolved in water.

dissolved oxygen The amount of oxygen dissolved in water or wastewater, usually expressed in milligrams per liter, parts per million, or percent of saturation.

distinct population segment A subdivision of a species that is treated as a species for purposes of listing under the Endangered Species Act. The smallest division of a taxonomic species that can be protected under the Endangered Species Act.

drainage area The area of land from which water drains into a river; for example, the Sacramento River Basin, in which all land area drains into the Sacramento River. Also called a watershed, drainage basin, or river basin.

drought preparedness The magnitude and probability of economic, social, or environmental consequences that would occur as a result of a sustained drought under a given study plan.

drought condition Hydrologic conditions during a defined period, greater than one dry year, when precipitation and runoff are much less than average.

drought year supply The average annual supply of a water development system during a defined drought period.

Delta Simulation Model 2 (DSM2) A hydrodynamic and water quality simulation model used to simulate water quality conditions in the Sacramento-San Joaquin Delta. The model is frequently used to evaluate potential changes in Delta conditions (salinity, flow, and water level) associated with changes in flow patterns in the Delta.

E

ecosystem restoration The activity of improving the condition of natural landscapes and biotic communities.

effluent Wastewater or other liquid, treated or in its natural state, flowing from a treatment plant or process.

electrical conductivity The measure of the ability of water to conduct an electrical current, the magnitude of which depends on the dissolved mineral content of the water.

endangered species An animal or plant species in danger of extinction throughout all or a significant portion of its range.

entrainment The unintended diversion of fish (or other aquatic organisms) into an unsafe passage route. The incidental trapping of any life stage of fish within waterways or structures that carry water being diverted for use

elsewhere. Fish are considered “entrained” when they enter a diversion point, which for the SWP is Clifton Court Forebay.

environmental impact report A report done to analyze project or program impacts on a variety of resources under the California Environmental Quality Act.

environmental impact statement A report done to analyze project or program impacts on a variety of resources under National Environmental Policy Act.

environmental water The water for wetlands, for the instream flow in a major river or in the Bay-Delta, or for a designated wild and scenic river.

escapement The portion of an anadromous fish population that escapes commercial and recreational fisheries and reaches its freshwater spawning grounds.

estuary A semi-closed coastal body of water where the lower course of a river enters the sea, influenced by tidal action where the tide meets the river flow, resulting in brackish water.

evapotranspiration The amount of water transpired by plants, retained in plant tissues, and evaporated from plant tissues and surrounding soil surfaces. (See also, reference evapotranspiration.)

excess water conditions Periods when it is agreed that releases from upstream reservoirs plus unregulated flow exceeds Sacramento Valley in-basin uses plus exports. DWR and Reclamation jointly decide when balanced or excess water conditions exist. During excess water conditions, sufficient water is available to meet all beneficial needs and the CVP and SWP are not required to supplement the supply with water from reservoir storage.

export An amount of water transported from one source or location to another.

F

firm yield The maximum annual supply of a water development project under drought conditions, for some specified level of demand.

flagellates Organisms with one or more whip-like structures called flagella, which are used for locomotion or feeding.

floodplain A strip of relatively level land bordering a stream or river that is often inundated during times of high water.

forages Food for animals, especially crops grown to feed horses, cattle, and other livestock.

forebay A reservoir at the intake of a pumping plant or power plant to stabilize water levels; also a storage basin for regulating water for percolation into groundwater basins.

fork length A measurement used frequently for fish length when the tail has a fork shape; projected straight distance between the tip of the snout and the fork of the tail.

freeboard The height of the physical top of a levee above a specified water surface elevation. This serves as a factor of safety for containing water in the stream or reservoir without overtopping the levee or dam.

fry Young, recently hatched fish that are able to swim and catch their own food.

G

greenhouse gas emissions Also referred to as carbon intensity or carbon footprint. Gases that trap heat in the atmosphere are called greenhouse gases. These include carbon dioxide, methane, nitrous oxide, and fluorinated gases.

grilse A term that generally refers to young adult salmonids of a certain length and age. Grilse are often 55-65 centimeters (22-26 inches) in length. They are assumed to be two years old, and adults are assumed to be age three and older.

groundwater Water located beneath the land surface and fills the pore spaces of the alluvium, soil, or rock formation in which it is situated. It excludes soil moisture, which refers to water held by capillary action in the upper unsaturated zones of soil or rock.

groundwater bank Groundwater banking refers to the practice of recharging specific amounts of water in a groundwater basin during wet or above-average years, which can later be withdrawn and used by the depositing entity.

groundwater basin An alluvial aquifer or a stacked series of alluvial aquifers with reasonably well-defined boundaries in a lateral direction and having a definable bottom.

groundwater recharge The natural or intentional infiltration of surface water into the zone of saturation (i.e., into groundwater).

groundwater storage capacity The volume of void space that can be occupied by water in a given volume of a formation, aquifer, or groundwater basin.

groundwater table The upper surface of the zone of saturation in an unconfined aquifer.

H

habitat The place or environment where a plant or animal naturally lives and grows (a group of particular environmental conditions).

habitat conservation plan A plan that outlines ways of maintaining, enhancing, and protecting a given habitat type needed to protect species; usually includes measures to minimize impacts, and may include provisions for permanently protecting land, restoring habitat, and relocating plants or animals to another area. Required before a federal Endangered Species Act incidental take permit may be issued.

halophyte A plant capable of growing in salty soil.

haptophyte A kind of unicellular marine phytoplankton, typically covered in tiny scales or plates composed of carbohydrates and calcium deposits.

hydraulic barrier (1) A barrier created by injecting fresh water to control seawater intrusion in an aquifer, or created by water injection to control migration of contaminants in an aquifer. (2) A barrier developed in the estuary by release of fresh water from upstream reservoirs to prevent intrusion of sea water into the body of fresh water.

hydrologic balance An accounting of all water inflow to, water outflow from, and changes in water storage within a hydrologic unit over a specified period of time.

hydrologic basin Where, conceptually, any drop of water that falls in the basin will flow to a stream or groundwater basin within it. It is a larger set of which a subset is the groundwater basin which can be within a hydrologic basin. DWR's hydrologic regions are collections of the larger hydrologic basins.

hydrologic region A geographical division of the State based on the local hydrologic basins. There are 10 hydrologic regions in California.

hydrology The science dealing with the occurrence, circulation, distribution, and properties of the waters of the earth and its atmosphere.

I

in-lieu recharge The practice of providing surplus surface water to historic groundwater users, thereby leaving groundwater in storage for later use.

ion exchange Processes of purification, separation, and decontamination of aqueous and other ion-containing solutions with solid ion exchangers such as sodium carbonate used for water softening.

instream use Use of water within its natural watercourse as specified in an agreement, water rights permit, etc. For example, the use of water for navigation, recreation, fish and wildlife, aesthetics, and scenic enjoyment.

integrated regional water management A comprehensive approach for determining the appropriate mix of demand and supply management options to provide long-term, reliable water supply at the lowest reasonable cost and with the highest possible benefits to customers, economic development, environmental quality, and other social objectives.

invertebrate An animal that lacks a backbone.

J

joint points of diversion The ability of the SWP to use Jones Pumping Plant as a point of diversion and the CVP to use Banks Pumping Plant as a point of diversion. The SWP and CVP may use one another's diversion facilities under certain conditions.

joint powers agreement An agreement entered into by two or more public agencies that allows them to jointly exercise any power common to the contracting parties. This is defined in Chapter 5 (commencing with Section 6500) of Division 7 of Title 1 of the California Government Code.

joint-use facilities Those portions of the SWP which serve both SWP and CVP functions, and in which both State and federal agencies participate in the construction and use; specifically, the San Luis complex and Reaches 3, 4, 5, 6, and 7 of the California Aqueduct.

jurisdictional dam Artificial barriers, together with appurtenant works, which are 25 feet or more in height or have an impounding capacity of 50 acre-feet or more, which are regulated by the Division of Safety of Dams.

K

kathablepharid A specific type of cryptomonad.

L

land subsidence The lowering of the natural land surface in response to earth movements, lowering of fluid pressure or groundwater level, consolidation of underlying soils, removal of underlying supporting materials by mining (oil and gas extraction), compaction caused by wetting, or oxidation of organic matter in soils (peat soil being converted to gas).

legal Delta The legal geographical boundaries of the Sacramento-San Joaquin Delta, as established by the Delta Protection Act of 1959, and as defined in California Water Code Section 12220.

listed species A species, subspecies, or distinct population segment that has been added to the federal list of endangered and threatened wildlife and plants. The term also applies to a species or subspecies added to the California list of endangered or threatened plants and animals.

M

maximum contaminant level The highest drinking water contaminant concentration allowed under federal and State Safe Drinking Water Act regulations.

mitigation (1) An action or set of actions designed to avoid, minimize, reduce, eliminate, or compensate for adverse environmental impacts due to an agency activity or program. (2) Reduction of human activities that affect global climate change; includes strategies to reduce greenhouse gas emissions.

Monterey Agreement An agreement executed in December 1994 among DWR and the SWP water contractors to address fundamental contract issues by amending the long-term water supply contracts.

Monterey Amendments Amendments to the long-term water supply contracts for the SWP entered into by DWR and most (27 of 29) of the SWP water contractors in 1995 and 1996 as implementation of the terms of the Monterey Agreement.

multipurpose project A project, usually a reservoir, designed to serve more than one purpose, and whose costs are normally allocated among the different functions it provides. For example, a project that provides water supply, flood control, and generates hydroelectricity.

N

natural community conservation planning (NCCP) A process that promotes multispecies and multihabitat management and conservation through cooperative efforts among public agencies, private landowners, and other interests within a plan area. It provides a framework for minimizing impacts on plant communities and wildlife from proposed development projects.

natural recharge Natural replenishment of an aquifer generally from snowmelt and runoff through seepage from the surface.

net groundwater The amount of groundwater extraction in excess of deep percolation.

nonreimbursable costs The part of project costs allocated to general statewide or national beneficial purposes and funded from general revenues, rather than by water users.

normalized demand The process of adjusting actual water use in a given year to account for unusual events such as dry weather conditions, government price support programs for agriculture, rationing programs, or other unusual conditions.

O

operational yield An optimal amount of groundwater that should be withdrawn from an aquifer system or a groundwater basin each year. It is a dynamic quantity that must be determined from a set of alternative groundwater management decisions subject to goals, objectives, and constraints of the management plan.

Operations Criteria and Plan (OCAP) (1) The document titled, "Long-Term Central Valley Project Operations Criteria and Plan," that serves as a baseline description of the facilities and operating environment of the CVP and SWP and identifies factors influencing the physical and institutional conditions and decision-making process under which the project currently operates. Regulatory and legal requirements are explained and alternative operating models and strategies described. (2) The document titled, "Central Valley Project Operations Criteria and Plan" (CVP-OCAP, 2004), that describes the laws, regulations, and other criteria applicable to operations of the CVP that were in effect from 1991 through 2003.

Operations Criteria and Plan biological opinion (1) The document titled, "Biological Opinion and Conference Opinion on the Long-Term Operations of the Central Valley Project and the State Water Project" (NOAA Fisheries, 2009). (2) The December 15, 2008, memorandum from USFWS to Reclamation that

comprises the USFWS biological opinion on the coordinated operations of the CVP and SWP.

otolith Ear bone of a fish. Otoliths often show seasonal or annual rings that can be used to determine age.

outflow The amount of applied water and conveyance water leaving the service area. Also conveyance outflow.

P

parr The developmental life stage of salmon and trout when the young have developed parr marks (vertical bars or spots on the sides of the fish) and are actively feeding in fresh water.

pelagic Inhabiting the water column as opposed to being associated with the bottom; generally occurring anywhere from the water's surface down to, but not including, the bottom.

pelagic fish Fish that live in open water, often near the surface.

perched groundwater Groundwater supported by a zone of material of low permeability located above an underlying main body of groundwater.

perennial yield The maximum quantity of water that can be annually withdrawn from a groundwater basin over a long period of time without developing an overdraft condition.

permeability The capability of soil or other geologic formations to transmit water.

phytoplankton Minute plants, such as algae, that live suspended in bodies of water and that drift about because they cannot move by themselves or because they are too small or too weak to swim effectively against a current.

precipitation A deposit on the earth of hail, rain, mist, sleet, or snow. It is the common process by which atmospheric water becomes surface or subsurface water.

project yield The water supply attributed to all features of a project, including integrated operation.

proposal solicitation package (PSP) As part of the formal solicitation for grant applications, a PSP provides detailed instructions on the mechanics of submitting proposals and specific information on submittal requirements.

public trust doctrine A legal doctrine recognizing public rights in the beds, banks, and waters of navigable waterways, and the State's power and duty to exercise continued supervision over them as trustee for the benefit of the people.

pump lift (1) The vertical distance that a pump will raise water. (2) The distance between the groundwater table and the overlying land surface.

pumped storage project A hydroelectric power plant and reservoir system using an arrangement whereby water released for generating energy during peak load periods is stored and pumped back into the upper reservoir, usually during periods of reduced power demand.

pumping-generating plant A plant which can either pump water or generate electricity, depending on the direction of water flow.

punch list A list of tasks or "to-do" items necessary for the completion of a construction project.

R

radial gates Gates used to control the flow of water into or from a reservoir, canal, pipeline, or through a channel. Each gate can close under its own weight and is operated independently by remote control.

radio-telemetry Automatic measurement and transmission of data from remote sources via radio to a receiving station for recording and analysis.

rate structure Designates the rate basis for cost recovery (e.g., flat, uniform, tiered, etc.). Block/Tiered rates are assumed to provide cost signals to consumers. Costs can include capital, operation and maintenance, financing, environmental compliance (documentation, permitting, and mitigation), etc.

reach On the California Aqueduct, a specific segment of the canal, identified by a number, which is the smallest unit of the SWP identified in water supply contracts for cost allocation and repayment purposes.

rearing Refers to the amount of time that juvenile fish spend feeding in nursery areas of rivers, lakes, streams, and estuaries before migration.

reasonable and prudent alternatives Alternative actions that can be implemented in a manner consistent with the intended purpose and scope of a project, are economically and technologically feasible, and would avoid the likelihood of jeopardizing the continued existence of listed species or resulting in the destruction or adverse modification of critical habitat.

recharge Water added to an aquifer or the process of adding water to an aquifer. Groundwater recharge occurs either naturally as the net gain from precipitation or artificially as the result of human influence.

recharge basin A surface facility constructed to infiltrate surface water into a groundwater basin.

recreation Water-dependent recreation activities that are consumptive (e.g., parks), flat-water (e.g., boating), or flow-based (e.g., whitewater rafting).

recycled water (1) The application of treated water/reclaimed water to meet a beneficial use, supplanting a potable or potentially potable supply. (2) Treated municipal, industrial, or agricultural wastewater to produce water that can be reused.

redd A shallow nest of fish eggs covered with gravel in a streambed.

reference evapotranspiration (ET_0) The evapotranspiration rate from an extended surface of 3 to 6 inch (8 to 15 centimeter) tall green grass cover of uniform height, actively growing, completely shading the ground, and not short on water (the reference ET reported by CIMIS).

reliability planning Water reliability management planning is done by comparing the costs of taking actions to maintain or increase reliability to the costs of accepting less reliability. On this basis, accepting of the costs of adverse effects of less than 100 percent reliability could be a legitimate planning decision. Providing full water supply to meet 100 percent of projected future water demand is not the planning goal, rather, the goal is to find the justified level of reliability.

reoperation See system reoperation.

repayment reach Aqueduct reaches are delineated for the purpose of making project repayment as equitable as possible. The reaches are generally numbered consecutively from the Delta with Reach 1 being first. Repayment reaches vary greatly in length. (See also, reach.)

required instream flow The amount of water required for instream use by agreement, water rights permit, or State/federal acts.

reused water The application of previously used water to meet a beneficial use, whether treated or not prior to the subsequent use (cf. recycled water).

return flow The portion of withdrawn water not consumed by evapotranspiration or system losses which returns to its source or to another body of water.

reverse osmosis A method to remove salts and other constituents from water by forcing water through membranes.

riparian area The area of land adjacent to a stream, lake, or wetland with vegetation that, due to the presence of water, is distinctly different from the vegetation of adjacent upland areas. Riparian areas provide important wildlife habitat (including fish habitat, when sufficient to overhang, extend into, or fall into the water).

riparian [water] right A right to use surface water, such right derived from the fact that the land in question abuts the banks of a stream or other water source (lake or pond). These rights are senior to most appropriative water rights.

run (of fish) A group of fish of the same species whose upstream spawning migration timing is associated with the seasons, e.g., fall, spring, summer, and winter runs. Members of a run may interbreed with fish of another run.

runoff The volume of surface flow from an area during a specified period. Natural runoff is the portion of precipitation that runs off the land and makes up the natural flow in rivers. Incidental runoff is the portion of precipitation that would have been used by natural vegetation but now contributes to runoff. This is a result of roads, paved areas, building roofs, land drainage systems, fields developed for irrigation, and other changes in land use.

S

sabellid polychaete A segmented marine worm which lives in a tube that it builds.

saline intrusion The movement of salt water into a body of fresh water. It can occur in either surface water or groundwater bodies.

salinity Generally, the concentration of mineral salts dissolved in water. Salinity may be expressed in terms of a concentration, weight (total dissolved solids), electrical conductivity, or osmotic pressure. When describing salinity influenced by seawater, salinity often refers to the concentration of chlorides in the water. (See also, total dissolved solids.)

salmonid A fish species belonging to the salmon family, including salmon and trout.

salt-water barrier A physical facility or method of operation designed to prevent the intrusion of saltwater into a body of fresh water.

salvage (fish) At the SWP and CVP fish protective facilities, fish are removed from export water, transported, and released away from the influence of the water diversion facilities.

sediment Soil or mineral material transported by water and deposited in streams or other bodies of water.

seepage The gradual movement of water into, through, or from a porous medium. Also, the infiltration of water into the soil from canals, ditches, laterals, watercourses, reservoirs, storage facilities, or other bodies of water or from a field.

service area The geographic area served by a water agency.

smolt A juvenile salmonid fish that has assumed the silvery color of the adult and, while migrating toward the ocean, is undergoing physiological changes that allow it to live in saltwater.

snowpack The annual accumulation of snow in mountain areas.

soluble minerals Naturally occurring substances capable of being dissolved.

special status species Plants or animals legally protected under either the federal or California Endangered Species Act or the California Fish and Game Code; those species not currently protected by statute but considered to be rare or endangered under the California Environmental Quality Act; and species considered by the scientific community to be sufficiently rare to qualify for such listing (e.g., candidate species for listing as threatened or endangered, species of concern to the Department of Fish and Wildlife or U.S. Fish and Wildlife Service, or rare plants identified by the California Native Plant Society).

species of concern An informal term referring to a species that might be in need of conservation action.

spillway The section of a dam designed to permit water to pass over its crest; a weir or channel taking overflow from the dam. The spillway serves as a safety channel to prevent erosion or overtopping of the dam.

sprinkler irrigation A method of irrigation in which the water is sprayed, or sprinkled, through the air to the ground surface.

stakeholder Individuals or groups who can affect or be affected by an organization's activities; individuals or groups with an interest or "stake" in what happens as a result of a decision or action.

State Water Project deliveries The volume of water imported to a given area from the State Water Project.

statewide water management systems These include physical facilities (more than 1,200 State, federal, and local reservoirs, as well as canals, treatment plants, and levees), which make up the backbone of water management in California; and statewide water management programs, which include water-quality standards, monitoring programs, economic incentives, water-pricing policies, and statewide water-efficiency programs such as appliance standards, labeling, and education.

strategic plan The long-term goals of an organization or program and an outline of how they will be achieved (e.g., adopting specific strategies, approaches, and methodologies).

stocking Releasing hatchery-raised fish into water body for the purposes of supplementing existing populations or creating new ones for fishing or to increase a species population. Same as planting.

streamflow The rate of water flow past a specified point in a channel.

subsidence See land subsidence.

surface storage Surface storage uses reservoirs to collect water for later release and use.

surface supply Water supply obtained from streams, lakes, and reservoirs.

system reoperation Changes to existing water system operations and management procedures for existing reservoirs and conveyance facilities to increase their water-related benefits.

T

threatened species An animal or plant species which is likely to become an endangered species within the foreseeable future throughout all or a significant portion of its range.

tidal wetlands The margins of an estuary that are periodically inundated by tides; includes all habitats within the elevation range between the lowest and highest tides: intertidal mudflats, regularly inundated tidal marsh plains, tidal channels within the marsh, and infrequently inundated wetland-upland transition zones at the edge of the upland.

total capital cost The total monetary cost of option required for “turnkey” implementation, including environmental and third-party impact mitigation, storage, conveyance, energy, capitalized operations and maintenance, administrative costs, planning costs, legal costs, and engineering costs.

total dissolved solids The quantity of the residual minerals dissolved in water that remain after evaporation of a solution.

transpiration An essential physiological process in which plant tissues give off water vapor to the atmosphere.

tributary A stream that flows into a larger stream or other body of water.

tubificid worm An aquatic worm with a small, thin, segmented body.

turbidity A measure of the cloudiness of water caused by the presence of suspended particles in the water which attenuate or reduce light penetration. Turbidity in natural waters may be composed of organic and/or inorganic constituents and may have direct implications to drinking water treatment.

turnout The point at which water is diverted from a main channel or water delivery facility to a distributing facility; a structure through which a water contractor takes delivery of water.

U

unimpaired flow The flow past a specified point on a natural stream that is unaffected by stream diversion, storage, import, export, return flow, or change in use caused by modifications in land use.

unimpaired runoff A representation of the natural water production of a river basin, unaltered by upstream diversions, storage, or by export or import of water to or from other watersheds.

Urban Water Management Planning Act Sections 10610 through 10657 of the California Water Code. The act requires urban water suppliers to prepare urban water management plans which describe and evaluate sources of water supplies, efficient uses of water, demand management measures, implementation strategies and schedules, and other relevant information and programs within their water service areas. Urban water suppliers (Section 10617) are either publicly or privately owned and provide water for municipal purposes, either directly or indirectly, to more than 3,000 customers or supply more than 3,000 acre-feet of water annually.

urban water use The use of water for urban purposes, including residential, commercial, industrial, recreation, energy production, military, and institutional classes. The term is applied in the sense that it is a kind of use rather than a place of use.

urban water use efficiency Methods or technologies resulting in the same beneficial residential, commercial, industrial, and institutional uses with less water or increased beneficial uses from existing water quantities.

V

vernal pools A type of wetland that occurs in shallow foothill and valley depressions. Water remains in pools and swales until it evaporates, usually within a few days to a few months, mainly in late winter and spring.

volatile organic compound (VOC) A man-made organic compound that readily vaporizes in the atmosphere. These compounds are often highly mobile in the groundwater system and are generally associated with industrial activities.

W

wastewater Domestic or municipal sewage or effluent from an industrial process.

water demand The desired quantity of water that would be used if the water were available and if a number of other factors, such as price, did not change. Demand is not static.

water exchanges Typically water delivered by one water user to another water user; the receiving water user will return the water at a specified time or when the conditions of the parties' agreement are met. (See also, water transfers.)

water quality Description of the chemical, physical, and biological characteristics of water, usually with regard to its suitability for a particular purpose or use.

water quality objectives Specific, legally enforced levels of water quality desired for identified uses, including drinking, recreation, farming, fish production, propagation of other aquatic life, and agricultural, industrial, and urban use.

water recycling The treatment of urban wastewater to a level rendering it suitable for a specific beneficial use.

water right In water law, the right of a user to use water from a water source (e.g., a river, stream, pond, or source of groundwater).

water service reliability The degree to which a water service system can successfully manage water shortages.

water supply exports The amount of water that a region transfers to another to meet needs.

water table See groundwater table.

water transfer A temporary or long-term change in the point of diversion, place of use, or purpose of use due to a transfer or exchange of water or water rights. A more general definition is that water transfers are a voluntary change in the way water is usually distributed among water users in response to water scarcity.

water year A continuous 12-month period for which hydrologic records are compiled and summarized. Different agencies may use different calendar periods for their water years. For DWR, a water year is October 1 through September 30.

watershed The land area from which water drains into a stream, river, or reservoir. Also called drainage area, drainage basin, or river basin.

watershed management The process of evaluating, planning, managing, restoring, and organizing land and other resource use within an area that has a single common drainage point.

weir (1) Any structure across a watercourse used to control, raise, or measure flows; (2) a barrier constructed to catch upstream migrating adult fish.

wetlands Lands including swamps, marshes, bogs, and similar areas such as wet meadows, river overflows, mud flats, and natural ponds. An area characterized by periodic inundation or saturation, certain types of soils, and vegetation adapted for life in saturated soil conditions.

Wild and Scenic River systems State and federally designated river systems under the 1968 national Wild and Scenic Rivers Act and the 1972 California Wild and Scenic Rivers Act. Seventeen rivers in California, including many forks and tributaries are designated wild, scenic, or recreational.

wheel As applied to water and power, to provide the use of one agency's conveyance facilities for the purpose of transporting another agency's supply.

X

X2 Delta outflow interaction with tides determines the location of the X2 isohaline salinity gradient. X2 is the location in the Bay-Delta Estuary where the tidally averaged bottom salinity is 2 parts per thousand. It is expressed as the distance in kilometers from the Golden Gate Bridge. X2 is used as a primary indicator in managing Delta outflow.

Z

zooplankton Small aquatic animals that are suspended or swimming in water.

Appendix B

Data and Computations

Used to

Determine 2013 Water Charges

Appendix B, Data and Computations Used to Determine 2013 Water Charges, was previously printed and distributed under a July 2012 cover letter from Robert Cooke, Chief of SWPAO, to State Water Project water contractors to document and support DWR's calculation of the contractors' annual charges. Appendix B appears on the following pages as it was published in July 2012. However, Table B-7 was not published in the July 2012 version of Appendix B because the data was not available at the time of publication. Table B-7 now appears in its entirety on page B-78.

Appendix B

Data and Computations Used to Determine 2013 Water Charges

The Department of Water Resources (DWR) annually furnishes Statements of Charges to the 29 long-term State Water Project (SWP) water supply contractors. Article 29(e) of the Standard Provisions for Water Supply Contracts, approved August 3, 1962, describes those statements:

All such statements shall be accompanied by the latest revised copies of the document amendatory to Article 22 and of Tables B, C, D, E, F, and G of this contract, together with such other data and computations used by the State in determining the amounts of the above charges as the State deems appropriate.

To comply with Article 29(e), DWR performs an annual comprehensive review and redetermination of all water supply and financial aspects of the SWP for the entire project repayment period. This annual redetermination is performed in accordance with Article 22(f) and Article 28 of the water supply contracts, which concern the Delta Water Rate and annual transportation charges, respectively.

Appendix B includes data used to document the redetermination of water charges to be paid by contractors during calendar year 2013. The information is based on established data about the SWP, both known and projected, as of June 2012; however, small volumes of water may be reclassified over time pursuant to long-term water supply contract provisions. If research requires more current data than was available at the time of production of

Bulletin 132, please contact the State Water Project Analysis Office. Where applicable, the projected data values shown in this appendix are shaded and the bill year data are in **bold** type.

The computational procedures and interrelationships between tabulations in this appendix are outlined on *Figures B-1 and B-2*. All tables referenced on *Figures B-1 and B-2* follow this text.

Types of Water Charges

Charges to SWP water supply contractors include the costs of facilities for the conservation and development of a water supply and the conveyance of such supply to SWP service areas. These facilities are classified as “Project Conservation Facilities” and “Project Transportation Facilities” in the Standard Provisions for Water Supply Contract. Names of the main facilities in each classification follow.

Project Conservation Facilities

- Frenchman Dam and Lake
- Grizzly Valley Dam and Lake Davis
- Antelope Dam and Lake
- Oroville Dam and Lake Oroville
- Oroville power facilities
- Delta facilities
- A portion of the California Aqueduct from the Delta to Dos Amigos Pumping Plant
- Sisk Dam, San Luis Reservoir, and

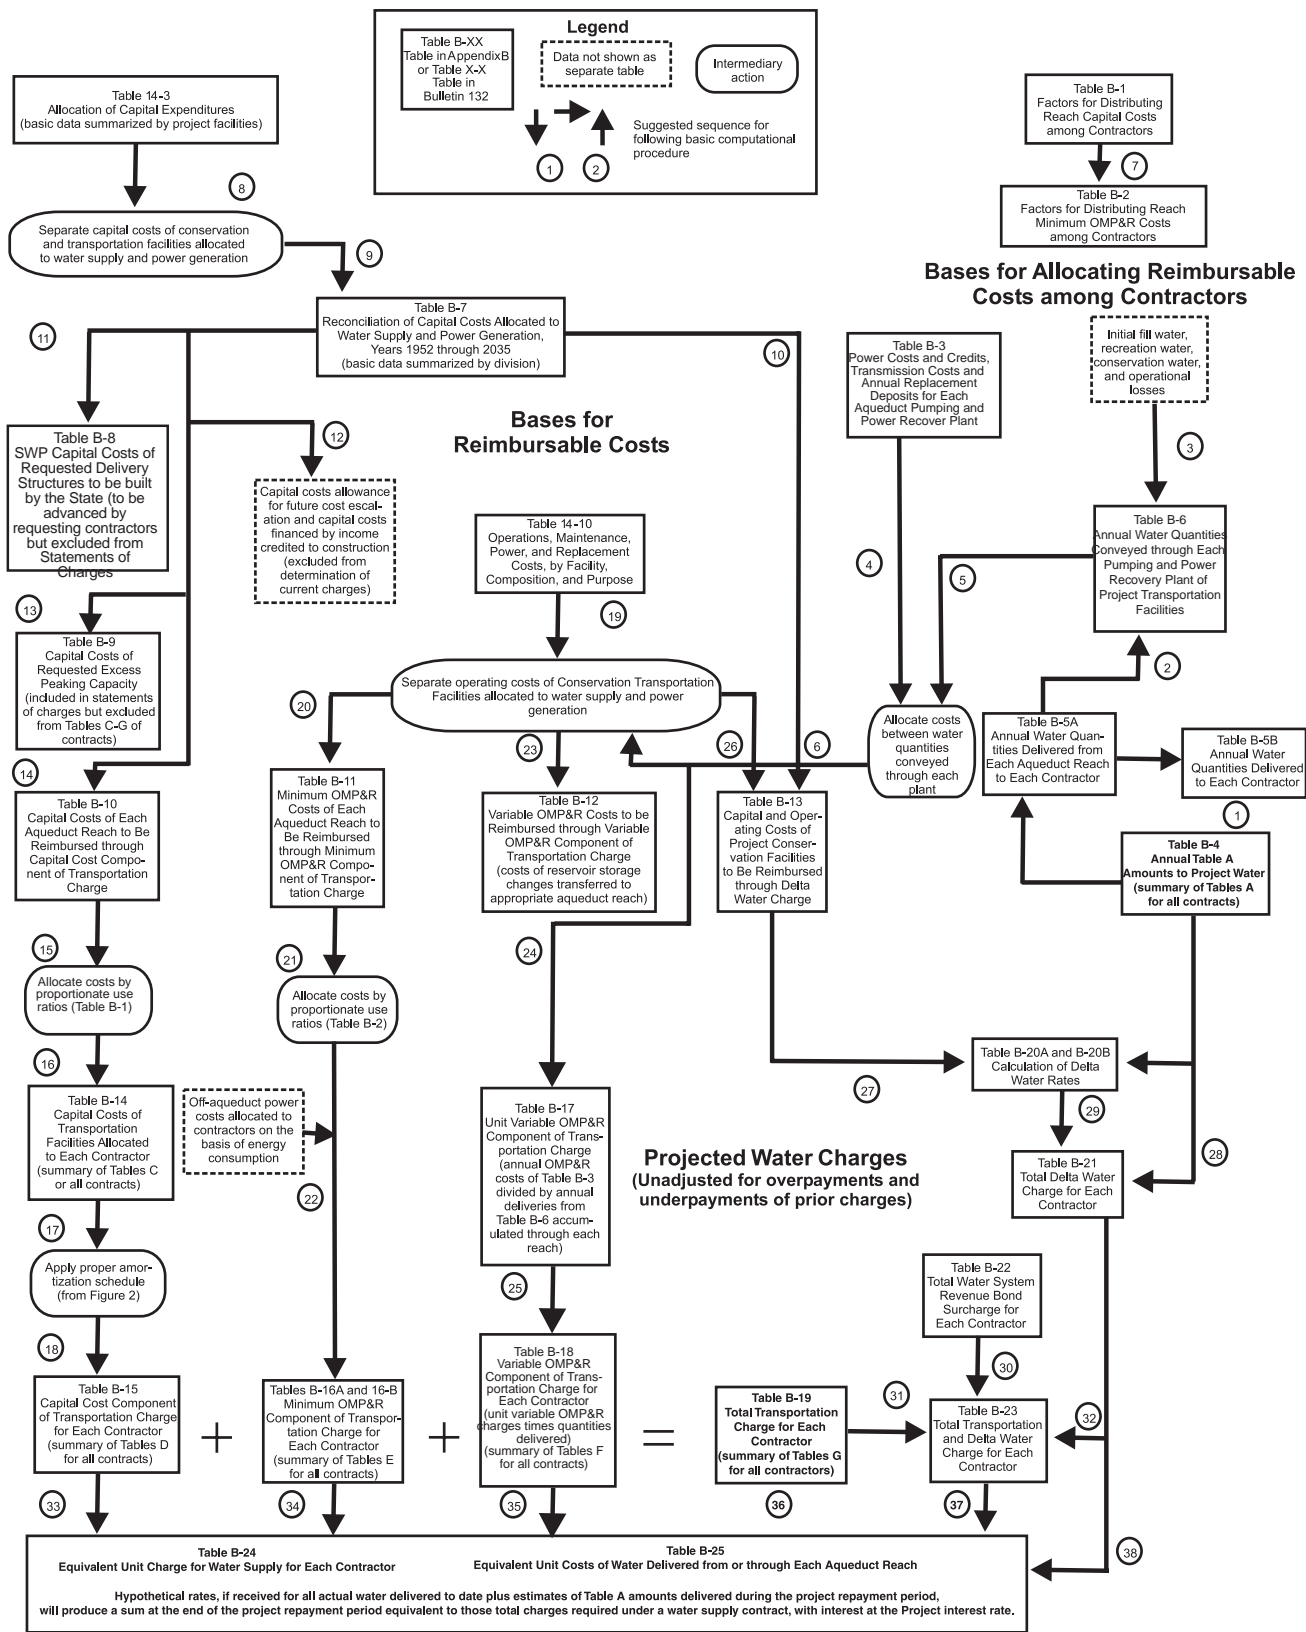

Figure B-1 Relationships of Data Used to Substantiate Statements of Charges

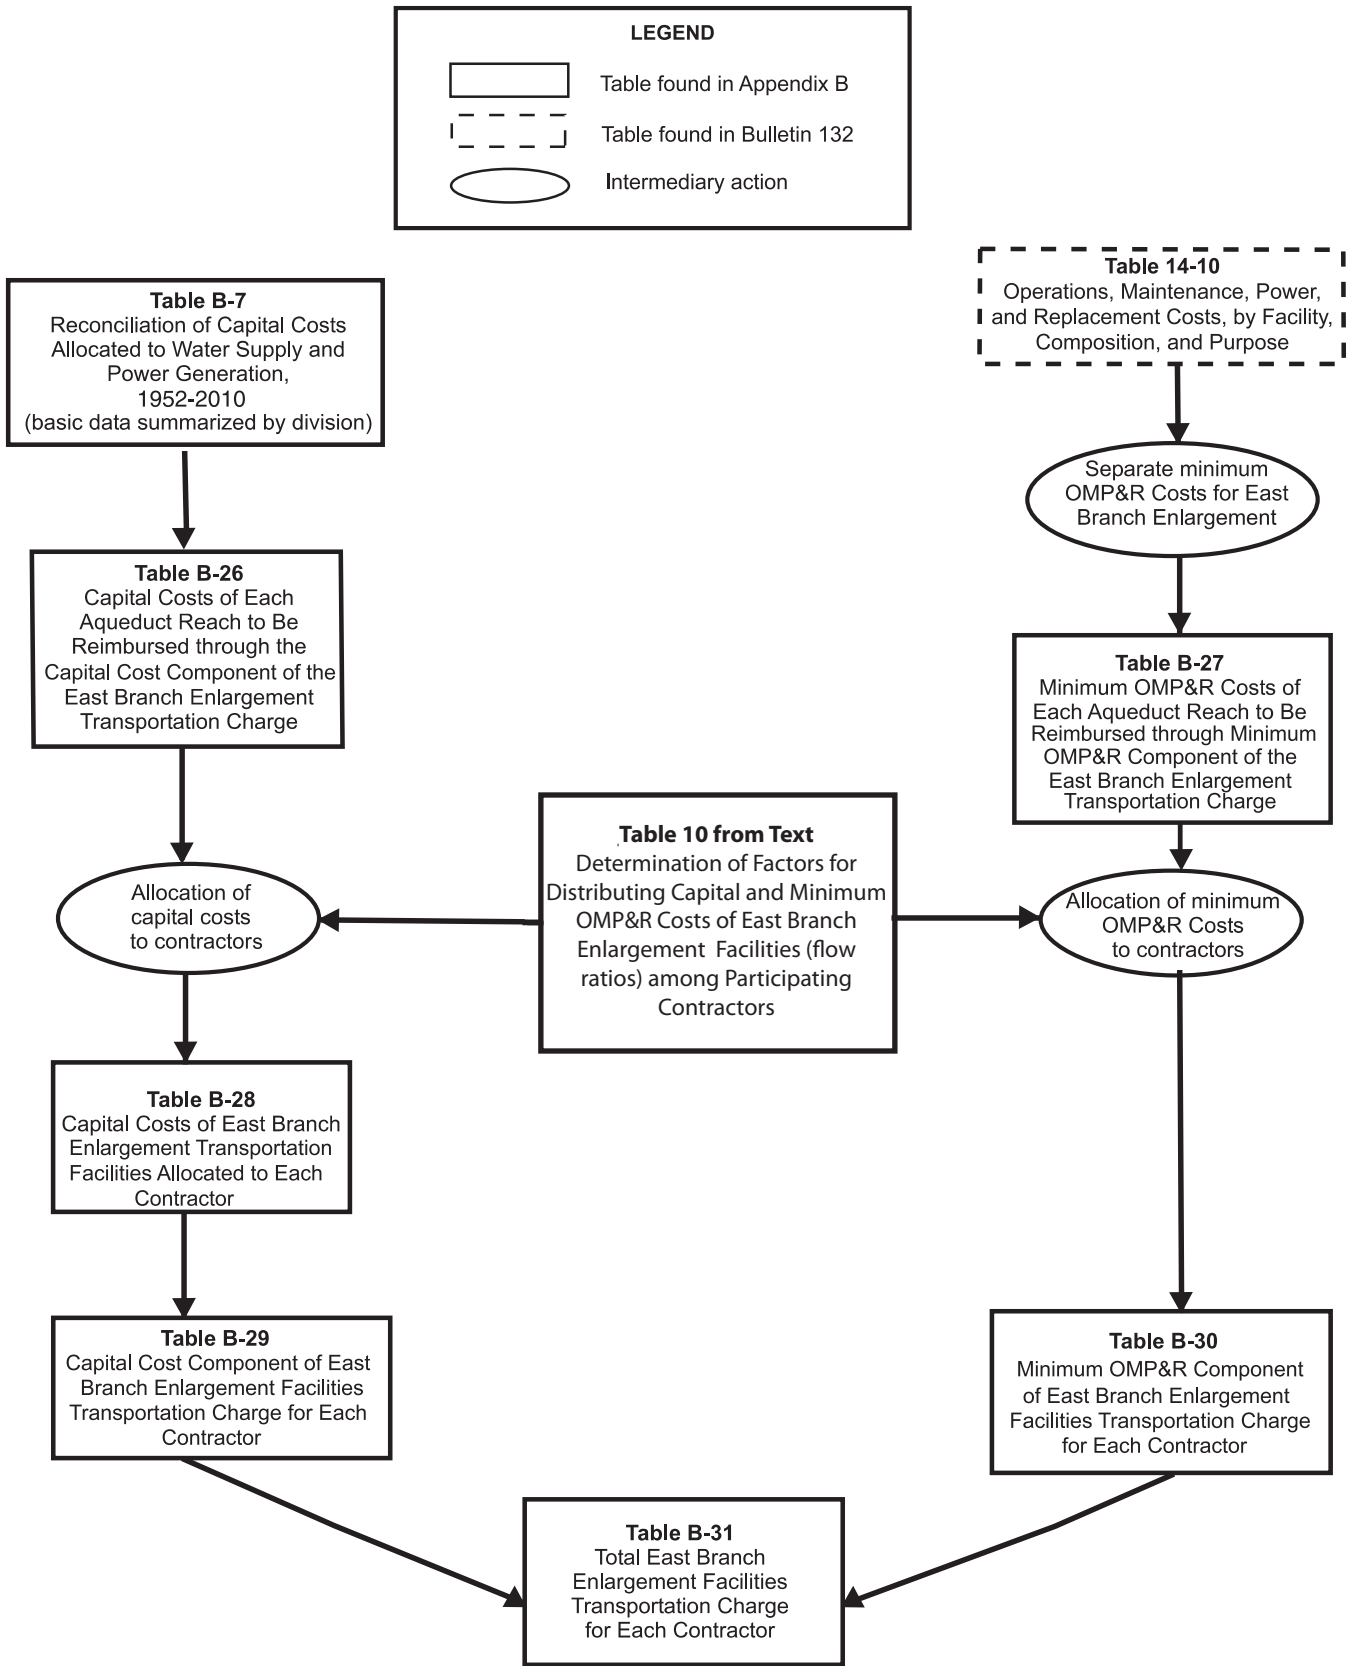

Figure B-2 Relationships of Data Used to Substantiate East Branch Enlargement Charges

Gianelli Pumping-Generating Plant

Project Transportation Facilities

- Grizzly Valley Pipeline
- North Bay Aqueduct
- South Bay Aqueduct, including Del Valle Dam and Lake del Valle
- The remainder of the California Aqueduct from the Delta to Dos Amigos Pumping Plant and all facilities south, including dams and lakes in Southern California
- Off-Aqueduct Power Facilities (Reid Gardner Unit No. 4, Bottlerock Powerplant, and South Geysers Powerplant)

The standard provisions provide for a Delta Water Charge and a Transportation Charge for project water.

The Delta Water Charge is a unit charge applied to each acre-foot of SWP water the contractors are to receive, in accordance with their contracts. The unit charge, if applied to each acre-foot of all such allocations for the remainder of the project repayment period, is calculated to result in repayment of all outstanding reimbursable costs of the Project Conservation Facilities, with appropriate interest, by the end of the repayment period (2035).

The Transportation Charge is for use of facilities to transport water to the vicinity of each contractor's turnout(s). Generally, the annual charge represents each contractor's proportionate share of the reimbursable capital costs and operating costs of the Project Transportation Facilities.

Each contractor's allocated share of those reimbursable capital costs is amortized for repayment to the State, and certain variations are allowed in the amortization

methods. Contractors' shares of reimbursable operating costs are repaid in the year such costs are incurred by the State.

The East Branch Enlargement Transportation Charge is paid by the seven Southern California contractors participating in the enlargement. San Bernardino Valley Municipal Water District advanced funds to pay the district's allocated capital costs for the East Branch Enlargement. The remaining six contractors pay an allocated share of the debt service on revenue bonds sold to finance the enlargement. Each contractor also will pay an allocated share of the minimum operation, maintenance, power, and replacement (OMP&R) costs of the East Branch Enlargement.

Transportation charges for the Coastal Branch Extension, East Branch Extension, and South Bay Enlargement are being repaid by contractors in their respective service areas.

Transportation charges for the Tehachapi Afterbay are repaid by those contractors using electrical power for delivery of their Table A water downstream of the Tehachapi Afterbay.

Composition and Timing of Water Charges

As shown on *Figure B-3*, the Delta Water Charge and the Transportation Charge consist of the following three components:

1. Conservation and transportation capital cost components, which will return to the State all reimbursable capital costs;
2. Conservation and transportation minimum OMP&R components, which will return to the State all reimbursable operating costs that do not depend on

Delta Water Charge

Capital Cost Component

1. Planning, design, right-of-way, and construction costs of Conservation Facilities
2. Operations and maintenance costs for newly constructed Conservation Facilities prior to initial operations
3. Activation costs for newly constructed Conservation Facilities
4. Power costs allocated to initial filling of San Luis Reservoir
5. Capitalized O&M costs (major repair work and so forth) for Conservation Facilities
6. Program costs (portion) to mitigate impacts on current Delta fishery population due to SWP pumping prior to 1986
(Department of Water Resources-Department of Fish and Game agreement)

Minimum OMP&R Component

1. Direct O&M costs of Conservation Facilities
 - a. Headquarters and field divisions (portion)
 - b. Insurance and FERC costs (portion)
2. General O&M costs allocated to Conservation Facilities
 - a. Contractor Accounting Office (portion)
 - b. Financial and contract administration (portion)
 - c. Water rights
 - d. Power planning for SWP facilities (portion)
3. Replacement deposits for SWP control centers (portion)
4. Credits for a portion of Hyatt-Thermalito power generation
5. Power costs and credits related to pumping water to San Luis Reservoir for project operations (storage changes)
6. Value of power used and generated by Gianelli Pumping-Generating Plant
7. Program costs (portion) to offset annual fish losses resulting from pumping at Banks Pumping Plant
(Department of Water Resources-Department of Fish and Game agreement)

Transportation Charge

Capital Cost Component

1. Planning, design, right-of-way, and construction costs of Transportation Facilities
2. O&M costs for newly constructed Transportation Facilities prior to initial operation
3. Activation costs for newly constructed Transportation Facilities
4. Power costs allocated to initial filling of Southern California reservoirs
5. Capitalized O&M costs (major repair work and so forth) for Transportation Facilities
6. Program costs (portion) to mitigate impacts on current Delta fishery population due to SWP pumping prior to 1986
(Department of Water Resources-Department of Fish and Game agreement)

Minimum OMP&R Component

1. Direct O&M costs of Transportation Facilities
 - a. Headquarters and field divisions (portion)
 - b. Insurance and FERC costs (portion)
2. General O&M costs related to Transportation Facilities
 - a. Contractor Accounting Office (portion)
 - b. Financial and contract administration (portion)
 - c. Power planning for SWP facilities (portion)
3. Power costs and credits related to pumping water to Southern California reservoirs for project operations (storage changes)
4. Power costs for pumping water to replenish losses from Transportation Facilities
5. Other power costs
 - a. Station service at Transportation Facility power and pumping plants
 - b. Transmission service costs related to "backbone" Transportation Facilities
6. Replacement deposits for SWP control centers (portion)
7. Off-Aqueduct Power Facility costs—bond service, bond cover costs (25 percent of bond service), bond reserves, transmission costs to provide service to backbone," fuel costs taxes, and O&M-less power sales allocated to Off-Aqueduct Power Facilities
8. Program costs (portion) to offset annual fish losses resulting from pumping at Banks Pumping Plant
(Department of Water Resources-Department of Fish and Game agreement)

Variable OMP&R Component

1. Power purchase costs
 - a. Capacity
 - b. Energy
 - c. Pine Flat bond service, O&M, and transmission costs allocated to aqueduct pumping plants
2. Alamo, Devil Canyon, Warne, and Castaic power generation credited at the powerplant reach and charged to aqueduct pumping plants
3. Hyatt-Thermalito Diversion Dam powerplant generation charged to aqueduct pumping plants (credits for this generation are reflected in the Delta Water Rate)
4. Replacement deposits for equipment at pumping plants and powerplants
5. Credits from sale of excess SWP system power
6. Program costs (portion) to offset annual fish losses resulting from pumping at Banks Pumping Plant
(Department of Water Resources-Department of Fish and Game agreement)

Note: Excludes costs recovered under the East Branch Enlargement Transportation Charge.

Figure B-3 Composition of Delta Water Charge and Transportation Charge

or vary with quantities of water actually delivered to the contractors; and

3. A transportation variable OMP&R component, which will return to the State all reimbursable operating costs that depend on, and vary with, quantities of water actually delivered to the contractors.

The formula for computing the Delta Water Rate, Article 22(f) of the Standard Provisions for Water Supply Contract, was designed to ensure that all adjustments for prior overpayments or underpayments of the Delta Water Charge are accounted for in a redetermination of the rate. Since the redetermined rate applies to all future allocations, such adjustments are amortized during the remainder of the project repayment period. This appendix includes a redetermination of the Delta Water Rate for 2013.

Article 28 of the standard provisions stipulates that Transportation Charges be redetermined each year. The tables in Appendix B include the numerical data used in this redetermination. Transportation Charges for prior years through 2012, included in those tables are the redetermined amounts, and do not equal the amounts actually paid by contractors.

As provided under the Water System Revenue Bond Amendment to the water supply contracts, differences between actual payments under the Transportation capital cost component and amounts computed in this redetermination are accumulated with interest and amortized during the remaining years of the contract repayment period. All computations for adjustments are included in the attachments accompanying each contractor's Statement of Charges and are reflected in revised copies of Table C through Table G of the contract, which are

also furnished to each long-term water supply contractor in the annual statements of charges.

These redeterminations exclude four charges associated with water service other than the Delta Water Charge and the Transportation Charge. The excluded charges (and the manner in which they are treated in this appendix) are outlined below.

1. Advances of funds pursuant to Article 24(d) of the standard provisions for excess capacity constructed by the State at the request of contractors.
2. Advances of funds pursuant to Article 10(d) of the standard provisions for delivery structures (turnouts) constructed by the State at the request of contractors. Partial information concerning actual and projected capital costs of such delivery structures is included in this appendix. Statements concerning these costs and data are furnished to the appropriate contractors at various times and are not part of the annual statements.
3. Payments for sale and service of surplus water to entities other than contractors, pursuant to Article 21 of the standard provisions, are also excluded. Those payments are generally based on the unit rates shown in Table B-25. Net revenues resulting from noncontractor service are applied as indicated on page 24 of Bulletin 132-71.
4. Payments under the Devil Canyon-Castaic contract for costs of the Devil Canyon-Castaic facilities allocable to power generation. Charges billed as a result of the contract are billed separately from those billed as a result of the water supply contract. Information about the treatment of such charges in relation to redetermined

Transportation Charges is included in special attachments to the bills of the six participating contractors.

Time and method of payment for corresponding components of the Delta Water Charge and the Transportation Charge are as follows:

1. The capital cost components of the Delta Water Charge and the Transportation Charge are paid in two semiannual installments, due January 1 and July 1 of each year, based on statements furnished by the State on or before July 1 of the preceding year.
2. The minimum OMP&R components of the Delta Water Charge and the Transportation Charge are paid in 12 equal installments, due the first of each month and based on statements furnished by the State on or before July 1 of the preceding year.
3. The variable OMP&R component of the Transportation Charge is paid in varying monthly amounts and is due the fifteenth day of the second month following actual water delivery. The charges are projected based on a unit charge per acre-foot established on or before July 1 of the preceding year. Those unit charges may be revised during the year to reflect current power costs and revenues. The unit charges are applied to actual monthly delivery quantities as determined by the State on or before the fifteenth day of the month following actual water delivery.

Bases for Allocating Reimbursable Costs among Contractors

This section describes procedures for allocating reimbursable costs of Project Transportation Facilities among contractors (see upper right portion of Figure B-1). Those costs do not include annual costs of Off-Aqueduct Power Facilities, which are explained in the “Project Water Charges” section.

Capital and Minimum OMP&R Costs

Figure B-4 includes information about the repayment reaches that form the basis for allocating reimbursable costs of the Project Transportation Facilities among contractors.

Allocations of reimbursable capital costs and minimum OMP&R costs of each reach are based on the proportionate maximum use of that reach by respective contractors under planned conditions of full development.

The derivation of ratios that represent the proportionate maximum use of each aqueduct reach by the respective contractors was first reported in Bulletin 132-70. The ratios in Bulletin 132-70 were subsequently revised for the North Bay Aqueduct, the South Bay Aqueduct, the California Aqueduct from the Delta to Castaic Lake, and the Coastal Branch.

All the revisions reported in previous bulletins regarding the derivation of ratios that represent the proportionate maximum use of each aqueduct reach by the respective contractors were last reported in Tables B-1 and B-2 of Bulletin 132-91. Under Article 53 of the Monterey Amendment, agricultural contractors may sell up to 130,000 acre-feet of aqueduct capacity to municipal and industrial contractors. The first permanent transfer occurred in 1998. Currently,

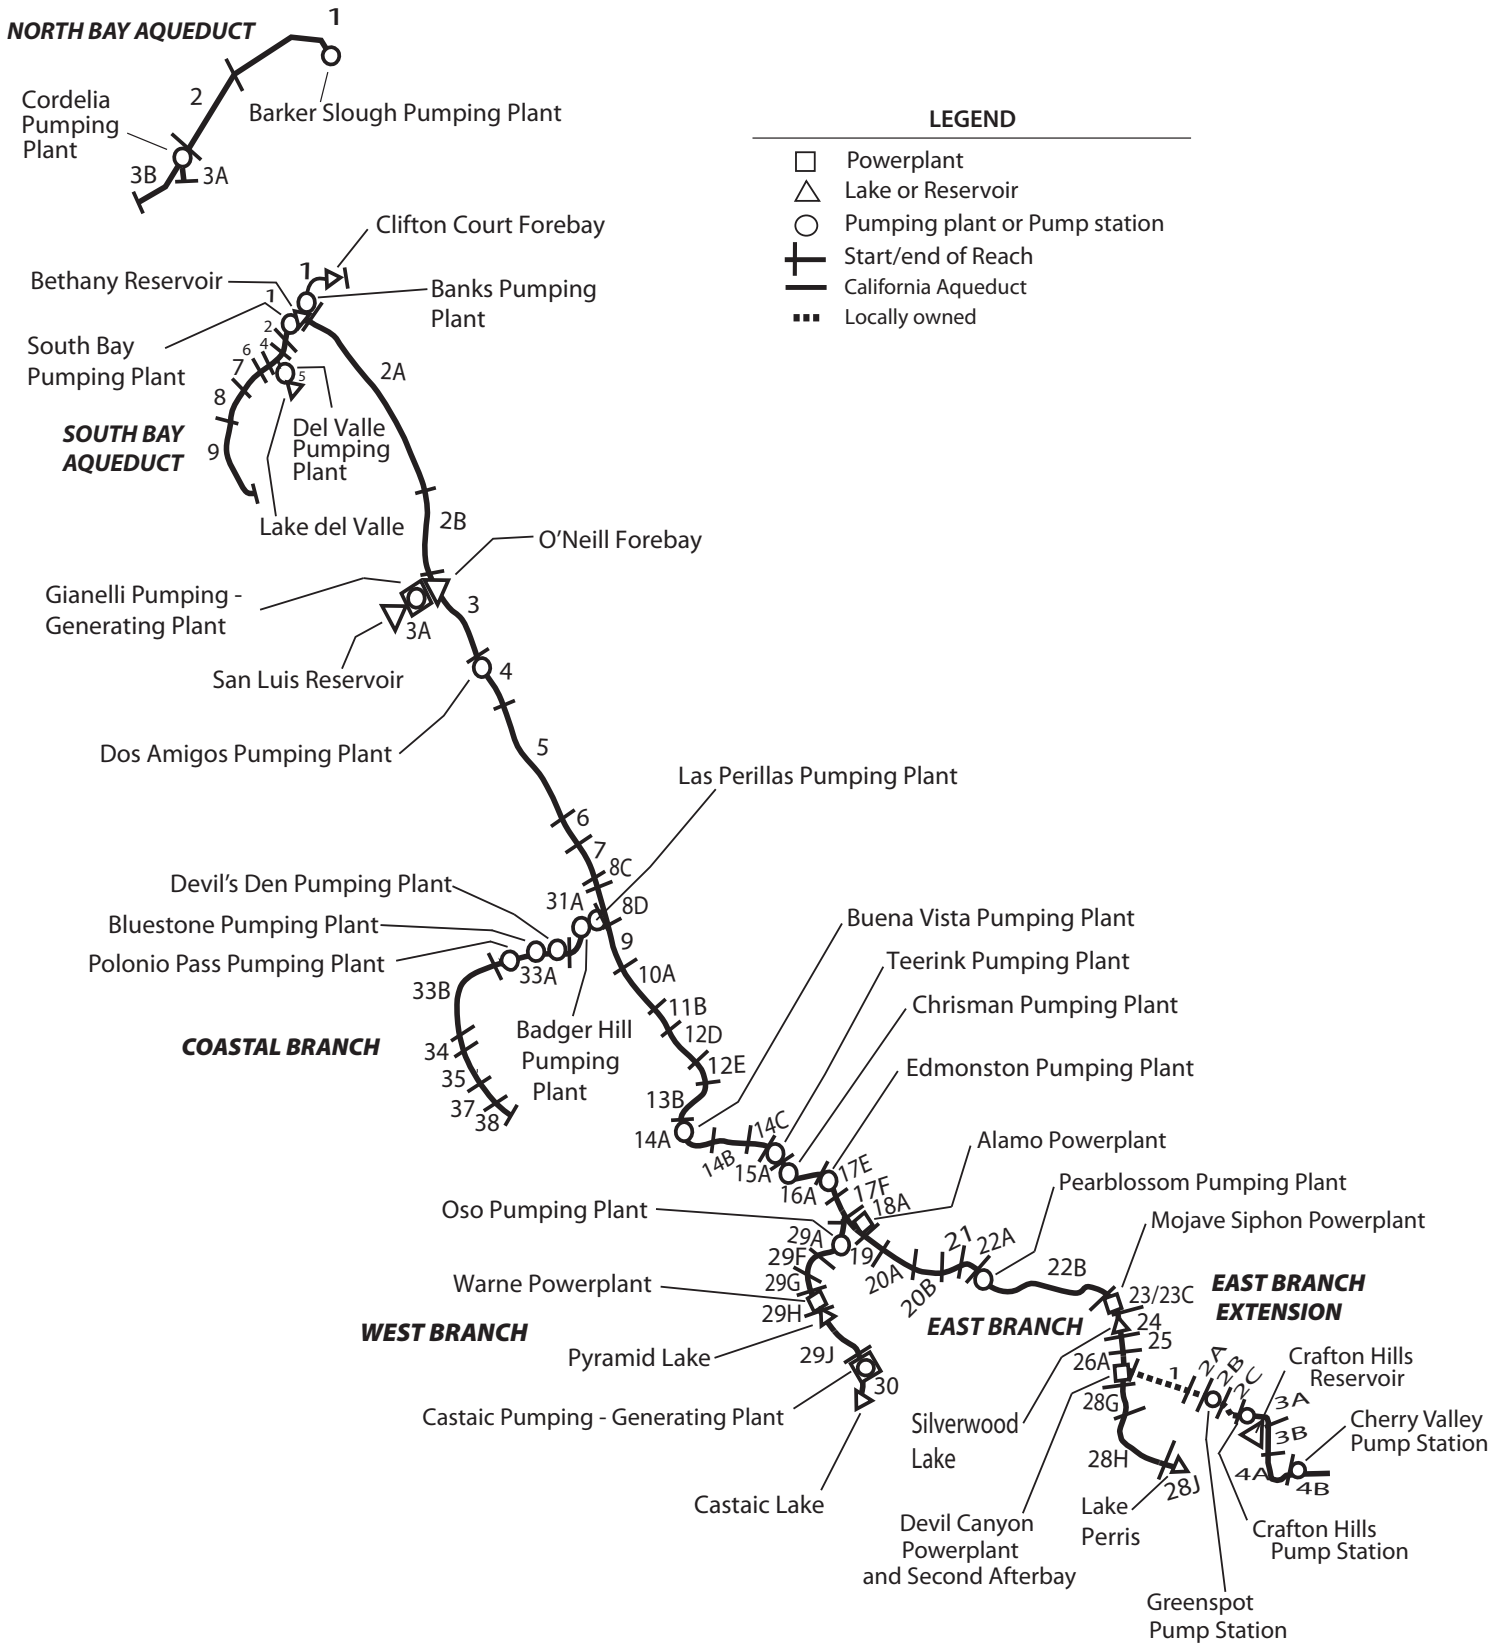

Figure B-4 Repayment Reaches and Descriptions

North Bay Aqueduct

- 1 Barker Slough through Fairfield /Vacaville Turnout
- 2 Fairfield/Vacaville Turnout to Cordelia Forebay
- 3A Cordelia Forebay through Benicia and Vallejo Turnouts

- 2B Greenspot Pump Station to Morton Canyon Valve Vault
- 2C Morton Canyon Valve Vault to Crafton Hills Pump Station
- 3A Crafton Hills Pump Station to Carter Street Valve Vault
- 3B Carter Street Valve Vault to Garden Air Creek, South of San Bernardino/Riverside County Line
- 4A Garden Air Creek to Cherry Valley Pump Station
- 4B Cherry Valley Pump Station to Terminus at Noble Creek

West Branch, California Aqueduct

- 29A Junction, California Aqueduct through Oso Pumping Plant
- 29F Oso Pumping Plant through Quail Embankment
- 29G Quail Embankment through Warne Powerplant
- 29H Pyramid Dam and Lake
- 29J Pyramid Lake through Castaic Powerplant
- 30 Castaic Dam and Lake

114,000 acre-feet of the allowable capacity has been transferred. *Table 1* shows the permanent capacity transfers that have taken place since the Monterey Amendment was implemented in 1995.

Table B-1 presents the reach ratios currently applicable to reimbursable capital costs.

Table B-2 presents corresponding ratios for allocating 2013 and after reimbursable minimum OMP&R costs among contractors. Requested excess capacity is omitted when deriving ratios applicable to capital costs because the capital costs for the excess capacity are paid on an incremental-cost basis and not a proportionate-use basis. However, requested excess capacity is accounted for in the ratios applicable to minimum OMP&R costs.

Variable OMP&R Costs

Article 26(a) includes provisions to ensure that the variable OMP&R component of the Transportation Charge will result in a return to the State of those costs that depend on and vary with the amount of SWP water deliveries. (The minimum OMP&R component results in a return of those operating costs that do not vary with deliveries.) Under Article 26(a) all such costs for a reach for a given year will be allocated among contractors in proportion to the actual annual use of that reach by the respective contractors.

Table B-3 summarizes the total power costs, credits, and transmission costs for each aqueduct pumping and power recovery plant. Variable costs are the following:

- Costs of capacity and energy used exclusive of associated power transmission and station service charges (transmission and station service costs that are independent and vary with

power usage are classified as minimum OMP&R costs).

- Credits for capacity and energy produced at aqueduct power recovery plants (treated as negative costs).
- Payments for replacement of major plant machinery components having economic lives shorter than the project repayment period. (In 1997, DWR discontinued charging for a sinking fund for replacements. Replacement costs, for 1999 and thereafter, are to be paid on an annual basis as the costs are incurred.)
- Beginning in 2005, a portion of transmission expenditures that will depend on and vary with water and power usage. These costs will be included as part of the variable component.

Table B-3 excludes plant capacity and energy costs associated with surplus and unscheduled water service after May 1, 1973. Prior to that date, surplus water service was charged the same unit variable OMP&R component as allocated water service. An amendment to the long-term water supply contracts in 1973 significantly changed the rate structure for surplus water service. Capacity and energy costs for pumping surplus and unscheduled water were allocated directly to those water contractors receiving surplus and unscheduled water service. A contract amendment in 1991 again revised the rate structure to provide for payment of costs through a melded power rate. These revisions to charges for surplus and unscheduled water are effective from the date of the amendments and are not applied to past charges.

An interruptible water program was established in 1994. This program, later renamed to Article 21 program, is based on individual annual contracts; costs for Article 21 water actually delivered are included in *Table B-3*.

Table 1 Summary of Permanent Aqueduct Capacity Transfers

Contractor		Capacity Transfer		Transfer Description
Seller	Buyer	Amount (af)	Effective Year	
Transfers under Monterey Amendment				
Kern	Mojave	25,000	1998	Purchased capacity upstream from Reach 31A

Water Conveyance

Tables B-4, B-5A, B-5A-Adj, B-5B, and B-6 present water conveyance quantities that form the basis for allocating costs.

Table B-4 presents the schedules of annual allocations as set forth in Table A and Article 6(a) of each water supply contract.

Table B-5A shows amounts of actual and projected allocated water quantities delivered from each aqueduct reach to each contractor. Projected deliveries for

years 2012 through 2035 are based on contractors' requests for future water deliveries. The quantities included in Table B-5A also include nonproject water delivered to contractors and surplus water deliveries prior to May 1, 1973, and actual Article 21 water deliveries in 1994 and after.

Table B-5A-Adj presents a summary of accounting adjustments that result from water deliveries not originating from the Sacramento-San Joaquin Delta. The methodologies used to calculate various components are based on cumulative

charges from the Delta through facilities conveying water to a specific repayment reach. When water is introduced to the SWP downstream of the Delta, contractors require an adjustment, or credit, for those facilities not used to convey the water.

Table B-5B presents a summary of actual and projected annual allocated water quantities for each contractor. The quantities also include amounts of nonproject water and surplus water delivered prior to May 1, 1973, and actual deliveries of Article 21 water in 1994 and after.

Table B-6 summarizes the annual allocated water quantities conveyed or to be conveyed through each aqueduct pumping plant or power plant for each of the following functions:

- *Deliveries-Water Supply.* Water made available to contractors at down-aqueduct delivery structures, including certain hypothetical quantities to facilitate cost allocations, for those years when deliveries are made from net annual storage withdrawals. The net annual amounts of storage withdrawals are hypothetically added to the actual amounts conveyed from the Delta to the reservoirs, since deliveries made from storage withdrawals bear the same variable OMP&R costs per acre-foot as they would if the deliveries were actually conveyed from the Delta in that year. The hypothetical increases in the deliveries made from reservoir storage withdrawals are offset by equal credits to the minimum OMP&R costs of the respective reservoirs. Thus, the variable OMP&R components per acre-foot (*Table B-17*) may be applied to the total annual quantities delivered either from aqueduct reservoir storage or from the Delta.
- *Initial Fill Water.* Water required for initial filling of down-aqueduct reaches and reservoirs or for repayment of pre-consolidation water used during construction.
- *Deliveries-Recreation.* Water delivered to down-aqueduct recreation developments or used for fish and wildlife enhancement.
- *Operational Losses.* Water lost through evaporation and seepage from all down-aqueduct reaches.
- *Reservoir Storage Changes.* Water placed in down-aqueduct reservoir storage after initial filling of the reservoirs, including projected net annual storage accretions (positive values) and withdrawals (negative values) for all down-aqueduct reservoirs of the Project Transportation Facilities.

Variable OMP&R costs (*Table B-12*) that are allocable to storage accretions are assigned to the minimum OMP&R costs of the respective reservoirs. With the exception of Banks Pumping Plant, "Reservoir Storage Changes" also includes SWP water placed into Southern California groundwater storage from 1978 through 1982 (as positive amounts); and water withdrawn from storage and delivered to contractors in 1979, 1982, 1987, 1988, and 1989 (as negative amounts). At Banks Pumping Plant, groundwater additions and withdrawals are included in "Conservation Water."

Table B-6 also summarizes the following two amounts under the heading "Conservation Water" (Column 25):

1. Net annual water amounts stored and projected to be stored in San Luis Reservoir.
2. Water lost and projected to be lost through evaporation and seepage from San Luis Reservoir and from the water conservation portion of the California Aqueduct.

"Conservation Water" includes initial fill water, operational losses, and net annual

storage changes associated with San Luis Reservoir and the portion of the California Aqueduct that is allocated to conservation. The same allocation procedure outlined previously for Transportation Facilities also applies to water delivered from storage in Conservation Facilities, except that the hypothetical cost increases are added to the variable OMP&R cost to be reimbursed through the Transportation Charge and deducted from the minimum OMP&R costs to be reimbursed through the Delta Water Charge.

San Luis Reservoir is operated to conserve water for future delivery to downstream contractors. To account for costs associated with reservoir storage, the power and replacement costs of Banks Pumping Plant (a joint Transportation-Conservation Facility) that are allocated to the conveyance of annual conservation water quantities are transferred to the capital costs of San Luis Reservoir (during initial fill) or to the minimum OMP&R costs of San Luis Reservoir (following initial fill).

In years of net storage withdrawal from San Luis Reservoir, a portion of the minimum OMP&R cost of the reservoir is transferred to the variable OMP&R cost of Banks Pumping Plant. That transfer is equal to the variable OMP&R cost per acre-foot of delivery through Banks Pumping Plant for that year, multiplied by the acre-feet of deliveries derived from San Luis Reservoir storage for that year. *Table B-6* also includes amounts of nonproject water and surplus water delivered prior to May 1, 1973, and actual deliveries of Article 21 water in 1994 and thereafter.

Bases for Reimbursable Costs

This section describes the methods used to derive the costs allocated by the procedures outlined in the preceding section. A diagram

of the cost derivation process is shown in the upper-left quadrant of Figure B-1.

First, the capital and minimum OMP&R costs of all SWP facilities are allocated among the various project purposes in accordance with the allocation percentages in *Table 2*. Those percentages may be subject to revision in the future.

The redeterminations in this appendix involve only the SWP costs that are allocated to water supply and power generation.

Capital Costs

Capital costs used in the redeterminations in this appendix reflect prices prevailing on December 31, 2011; future cost escalation will be reflected in subsequent bulletins.

Table B-7 presents a reconciliation of estimated total capital costs of each Project Conservation Facility and each Project Transportation Facility. This table shows the relationship of Project Conservation and Transportation costs allocated to contractors (*Tables B-8, B-9, B-10 and B-13*) to the total SWP capital costs projected by DWR.

Table B-8 shows costs incurred and projected to be incurred by the State in connection with each contractor's turnouts. Costs incurred by the State for both State-constructed and contractor-constructed delivery structures are paid directly by the contractors for which the structures are built. The State incurs design review and construction inspection costs in connection with contractor-constructed turnouts.

Table B-9 lists costs and payments for excess capacity built into SWP Transportation Facilities in accordance with amendments to contracts with Metropolitan Water District of Southern California (Metropolitan), San

Table 2 Project Purpose Cost Allocation Factors (Percentages)

PROJECT FACILITIES	Water Supply and Power Generation		All Other Purposes (Nonreimbursable)

Delta to Dos Amigos Pumping Plant	96.6	96.7	3.4	3.3
Dos Amigos Pumping Plant to termini (excluding Coastal Branch)	94.3	96.9	5.7	3.1
Coastal Branch	100.0	100.0	0.0	0.0

^(a)Percentages indicated are applicable to the remaining costs of division after excluding costs allocated to flood control that are reimbursed by the federal government (22 percent of capital costs) and excluding specific power costs of Hyatt and Thermalito Powerplants and switchyards.

^(b)Percentage indicated consists of 48.0 percent of costs allocated to recreation and 26.8 percent to flood control.

^(c)Percentage indicated consists of 44.9 percent of costs allocated to recreation and 33.1 percent to flood control.

Gabriel Valley Municipal Water District, and Antelope Valley-East Kern Water Agency, including the following:

- Additional costs incurred by the State for requested excess capacity;
- Advances by water contractors of funds for such costs; and
- Credits for advances in excess of costs, which were applied to respective contractors' installments of the capital cost component of the Transportation Charge in 1981.

Under Amendment 2 of Metropolitan's contract, 809 cubic feet per second of excess

capacity was originally constructed in reaches of the West Branch at Metropolitan's request. That capacity was reclassified as basic capacity of SWP Transportation Facilities under Amendment 7. Metropolitan paid \$16.3 million as a prepayment of the capital cost component of the Transportation Charge in lieu of advancing funds for the original requested capacity.

Amendment 5 to Metropolitan's contract requires that additional costs for modifications to the Santa Ana Pipeline (required for enlargement of Lake Perris) will be allocated to Metropolitan and returned to the State through payments of the Transportation Charge. The additional costs

to be repaid through Metropolitan's capital cost component for the aqueduct reach from Devil Canyon Powerplant to Barton Road total about \$6.7 million (see Bulletin 132-72, page 98).

Table B-10 presents the actual and projected annual capital costs of each aqueduct reach that will eventually be returned to the State, with interest, through contractors' payments of the capital cost component of the Transportation Charge and payment of debt service under the Devil Canyon-Castaic contracts.

Annual Operating Costs

Annual operating costs allocable to water supply and power generation are returned to the State through the minimum OMP&R components of the Delta Water Charge and the Transportation Charge and through a portion of the revenues from energy sales. All reimbursable operating costs of Conservation Facilities are included in the minimum OMP&R component of the Delta Water Charge.

Transportation and Devil Canyon-Castaic Contract Costs

Table B-11 shows the amounts of the actual and projected costs to be reimbursed through payments of the minimum OMP&R component of the Transportation Charge and allocated operating costs under the Devil Canyon-Castaic contract. The table includes the following seven types of operating costs incurred annually that do not vary with water quantities delivered to the contractors:

1. All direct labor charges for field operation and maintenance personnel, including associated indirect costs;
2. A distributed share of general operating costs that cannot be identified solely with one facility or aqueduct reach;

3. All of electric power transmission and station service costs up to 2004, and electric power transmission and station service costs for 2005 and after that do not vary with power usage allocable to aqueduct pumping and recovery plants;
4. All costs for equipment, materials, and supplies;
5. Portions of the power and replacement costs of all up-aqueduct pumping plants and power plants that are allocable to the annual conveyance of water lost to evaporation and seepage from respective aqueduct reaches or placed into storage in respective reservoirs of the project transportation facilities (after initial fill);
6. Credits, which offset those costs in (5) above, for deliveries drawn from reservoir storage; and
7. Escalation of projected operating costs at 3.0 percent per year for 2013 and 2014 plus
8. Escalation of projected operating costs at 1 percent per year for 2015-2035.

Table B-12 shows the portions of variable OMP&R costs in *Table B-3* that are allocable to the water supply delivery quantities included in *Table B-6* and reimbursed through payments of the variable OMP&R component of the Transportation Charge.

To derive *Table B-12* costs, the following adjustments are made to *Table B-3* costs:

1. Part of the variable OMP&R costs of each plant is allocated to recreation. The allocation to recreation is in proportion to the quantity of water conveyed through each plant each year for delivery to on-shore recreational developments. That portion of variable plant costs attributable to the initial fill of aqueduct reaches is

allocated to the joint capital costs of respective down-aqueduct reaches and reservoirs.

2. That portion of costs attributable to evaporation and seepage is allocated to the joint minimum OMP&R costs of respective down-aqueduct reaches and reservoirs.
3. Adjustments are made for additions or withdrawals from storage in aqueduct reservoirs. In years when water is added to storage in aqueduct reservoirs, the cost of conveying this water into storage is charged to the minimum OMP&R costs of the corresponding reservoir. In years when storage in aqueduct reservoirs is decreased for the purpose of making deliveries, a credit is applied to the minimum OMP&R costs of the reservoir from which the storage is released. This credit is equal to the number of acre-feet of storage reduction times the variable OMP&R unit rate for the year the storage is released. The unit rate is equal to the variable OMP&R unit rate for the year the water is taken from storage.
4. That portion of costs attributable to pumping water to replace evaporation and seepage losses and for additions or withdrawals from storage in San Luis Reservoir is charged to the minimum OMP&R component of the Delta Water Rate.

The remaining costs are allocated to transportation water supply and repaid by the contractors.

Conservation Capital and Operating Costs

Table B-13 is a summary of actual and projected capital and operating costs of the initial Project Conservation Facilities. These costs are reimbursed through payments by contractors under the Delta Water Charge,

Oroville power sales, and Gianelli Generating Plant credits. *Table B-13* also shows credits applied to the reimbursable capital costs of the Project Conservation Facilities in accordance with negotiated settlements concerning incurred planning costs for the period from 1952 through 1978.

Project Water Charges

This section describes the redetermination of past and projected components of the Transportation Charge for annual revision of Tables C through G of each water supply contract. This section also describes the derivation of the unit Delta Water Rates and the Water System Revenue Bond Surcharge.

A summary of equivalent unit charges for each acre-foot of allocated water service is also included for each contractor and each aqueduct reach. A diagram of all calculations may be found on the lower half of *Figure B-1*.

Transportation Charges

The accumulation of allocated costs of each aqueduct reach to each contractor is the basis for the Transportation Charge components.

Table B-14 summarizes each contractor's share of the capital costs of the aqueduct reaches presented in *Table B-10*. Those amounts are determined by applying proportionate-use ratios set forth in *Table B-1* to the costs in *Table B-10*. The resulting allocated costs are set forth in *Table C* of the respective water supply contracts.

Prepayments of the capital cost component, required under Metropolitan's Amendment 7, are included as negative capital costs in *Table B-14* and *Table C* of Metropolitan's Statement of Charges. Solano, Empire-West Side Irrigation District, and Castaic Lake

Water Agency also prepaid capital costs (see Table B-14 footnotes). Table B-14 includes costs of the East Branch Extension to provide water service to San Bernardino Valley Municipal Water District and San Geronio Pass Water Agency.

Both Table B-14 and Table C of the six contractors for project water service below Devil Canyon Powerplant and Castaic Powerplant include the capital costs reimbursable under the Devil Canyon-Castaic contract.

Table B-15 summarizes capital cost components of the Transportation Charge for each contractor for each year of the project repayment period. By the year 2035, the capital cost components shown in Table B-15 will recover the costs shown in Table B-14, with interest at the Project Interest Rate of 4.610 percent per annum and based on the amortization schedules included in *Table 3*.

Those estimated components, subsequently adjusted for prior overpayments or underpayments, are included in Table D of the water supply contracts. Costs of excess capacity are billed separately and are not included in Table B-15.

Table B-15 includes the debt service payments due from the six contractors down-aqueduct from Devil Canyon Powerplant and Castaic Powerplant, in accordance with terms of the Devil Canyon-Castaic contract.

Table B-16A summarizes the minimum OMP&R components of the Transportation Charge for each year of the project repayment period. Those estimated components, subsequently adjusted for prior overpayments or underpayments,

are included in Table E of the respective contracts.

The total amounts included in Table B-16A are determined by applying the proportionate-use ratios in Table B-2 to the reach costs in Table B-11.

Table B-16A excludes Off-Aqueduct Power Facility charges, which are included separately in *Table B-16B*. Both Table B-16A and Table E include the operating costs payable under the Devil Canyon-Castaic contract for the six contractors down-aqueduct from Devil Canyon Powerplant and Castaic Powerplant.

As part of operating agreements with DWR, Kern was billed from 1963 through 1987 for any additional operating costs caused by early installation of units in Las Perillas and Badger Hill Pumping Plants by Berrenda Mesa Water Storage District (see Bulletin 132-71, page 7). Under those agreements, a portion of minimum OMP&R costs of Reach 31A were assigned directly to Kern, as shown in *Table 4*, with the remaining reach costs allocated by application of the proportionate-use ratios. DWR purchased the last unit, Unit No. 6, at Las Perillas and Badger Hill Pumping Plants in early 1997 to provide pumping capacity for deliveries to Coastal Area contractors, which began in 1997.

As a result of the Monterey Amendment, the costs related to this settlement are to be allocated among all SWP contractors in proportion to their maximum Table A amounts. As costs are incurred, related charges will be included in the contractors' annual Statements of Charges as part of the minimum. It is estimated that between 2002 and 2010, the Monterey Amendment litigation costs will be slightly less than \$16 million.

Table 3 Criteria for Amortizing Capital Costs of Transportation Facilities

Contractor	Year of Initial Payment ^(a)
Alameda County Flood Control and Water Conservation District – Zone 7	1963 ^(b)
Alameda County Water District	1963
Antelope Valley—East Kern Water Agency	1963
Castaic Lake Water Agency	1964
City Yuba City	^(c)
Coachella Valley Water District	1964
County of Butte	^(c)
County of Kings	1968
Crestline-Lake Arrowhead Water Agency	1964

1995	272,341
1996	322,123
Total	3,997,767

Table B16-B summarizes annual Off-Aqueduct Power Facility charges allocated to each water contractor, adjusted for prior overpayments or underpayments. Those charges are to repay all Off-Aqueduct Power costs, including bond service, deposits for reserves, operation and maintenance costs, fuel costs, taxes, and insurance.

Adopted October 1, 1979, the General Bond Resolution requires that sufficient revenues be collected each year to repay all of those costs. In addition, an amount totaling 25 percent of the annual bond service is collected each year to ensure that sufficient funds are available to cover all annual costs. Any revenues collected and not needed during the year are refunded to the contractors in the next year.

Table 5 summarizes Off-Aqueduct Power Facility charges and credits related to deliveries for 2011. The Reid Gardner Powerplant Separation costs are tracked independently from annual Reid Gardner operating costs in anticipation of the Reid Gardner Powerplant contract expiration in 2013.

Table 5 Summary of 2011 Off-Aqueduct Power Facility Charges and Credits

Charges by Item	(Dollars)
Reid Gardner Powerplant	108,304,722
Reid Gardner Separation Costs	1,783,268
Bottle Rock Powerplant	11,907,030
South Geysers Powerplant	5,536,028
<i>Subtotal</i>	<i>127,531,048</i>
Credits by Item	
Power Sales	(2,014,679)
Net Total Charge	125,516,369

Table 6 shows projected Off-Aqueduct Power Facility charges and an amount equal to 25 percent of annual bond service for 2012 through 2035.

Annual Off-Aqueduct Power Facility charges are allocated among contractors in proportion to the electrical energy required to pump allocated water for the year. The initial allocation for the Statements of Charges is based on estimates of energy to pump requested allocated water deliveries.

An interim adjustment in the allocation of Off-Aqueduct Power costs may be made in May of each year, based on updated cost estimates and April revisions in water delivery schedules. An additional adjustment is made the following year based on actual water deliveries and actual costs for the year.

Table 6 Projected Charges for Off-Aqueduct Power Facilities

Year	Total Annual Cost (Dollars)	25% Bond Cover (Dollars)
2012	139,099,960	12,863,698
2013	73,637,100	7,147,620
2014	19,938,824	3,982,816
2015	11,689,081	2,332,867
2016	10,033,708	2,001,793
2017	9,676,915	1,930,434
2018	3,967,755	788,602
2019	3,947,196	784,490
2020	4,246,764	844,404
2021	6,183,738	1,231,799
2022	5,855,517	1,166,154
2023	4,315,040	858,059

2034	204,964	36,044
2035	208,933	36,838

The energy required to pump each contractor’s water is calculated using the kilowatt-hour per acre-foot factors shown in *Table 7* for the pumping plants upstream from the delivery turnouts. The amounts shown include transmission losses.

Table 7 Kilowatt-Hour per Acre-Foot Factors for Allocating Off-Aqueduct Power Facility Costs

Pumping Plant	kWh per acre-foot ^(a)	
	At Plant	Cumulative from Delta
Barker Slough	223	223
Cordelia-Benicia	434	657

Polonio Pass	705	2,826

^aIncludes transmission losses.

Table B-17 presents a summary of actual and projected total variable OMP&R costs for each acre-foot conveyed through each aqueduct pumping plant and power plant for each year of the project. Following are provisions for calculating the variable OMP&R component of the Transportation Charge:

- An annual charge per acre-foot of projected water deliveries to all contractors served from or through each reach is determined so the projected variable OMP&R costs to be incurred for each reach will be returned to the State.

- The total annual variable OMP&R component for any contractor for a given reach is obtained by multiplying the unit charge associated with that reach by the quantity of water actually delivered from or through the reach to the contractor.

The data summarized in Table B-17 are derived by dividing the costs shown in Table B-3 by the water quantities shown in Table B-6. However, certain costs included in Table B-3 for extra peaking service, which would otherwise constitute variable OMP&R costs, are assigned directly to contractors requesting this type of service (see Bulletin 132-71, page 21, and Water Service Contractors Council Memo No. 593, July 10, 1970). Those costs are excluded from the unit charges shown in Table B-17. Peaking charges based on additional capacity ceased in 1983. Since 1984, costs are based on market energy rates. The amounts of extra peaking charges for additional power costs are shown in *Tables 8 and 9* on pages B-22 and B-23, respectively.

Unit rates shown in Table B-17 constitute the rates for the pumping plants and power plants listed. The cumulative rates constitute the total rates, cumulative from the Sacramento-San Joaquin Delta, and are applicable to deliveries from or downstream of the pumping plants and power plants. Extra peaking service costs are excluded.

Table B-18 shows the variable OMP&R components of the Transportation Charge for each contractor for each year of the project repayment period. *Table B-18* is developed from the costs per acre-foot included in *Table B-17* and the delivery quantities for each contractor from each reach as indicated in *Table B-5A* and *Table B-5A-Adj*, plus any costs for extra peaking service. Those estimated components, subsequently adjusted for prior overpayments or

underpayments, are included in *Table F* of the respective water supply contracts.

Table B-19 summarizes the annual Transportation Charges for each contractor (the sums of the corresponding amounts included in *Tables B-15, B-16A, B-16B, and B-18*). Those estimated payments, subsequently adjusted for prior overpayments or underpayments, are set forth in *Table G* of the respective water supply contracts.

In accordance with provisions of the Devil Canyon-Castaic contract, *Table B-19* and *Table G* include amounts of debt service and operating cost payments due from the six contractors located down-aqueduct from Devil Canyon and Castaic powerplants.

Delta Water Charges

Table B-20A presents the calculation of the Delta Water Rate for the initial Conservation Facilities applicable in 2013 in accordance with the amended Article 22(e) and 22(g) of all 29 contracts. The Delta Water Rate was calculated at a Project Interest Rate of 4.610 percent, based on Conservation Facility costs shown in *Table B-13*. That Delta Water Rate is used to compute projected Delta Water Charges under Article 53(i) for the contractors who have executed the Monterey Amendment. Included in *Table B-20A* is the Delta Water Rate for the two contractors who have not executed the Monterey Amendment: Plumas County Flood Control and Water Conservation District and Empire West Side Irrigation District.

Table B-20B shows each component of the 2013 Delta Water Rate from *Table B-20A*.

Table B-21 summarizes the annual Delta Water Charge for each contractor. The projected charges in *Table B-21* are developed by multiplying the total rate

Table 8 Extra Peaking Charges for Additional Power, by Pumping Plant (Dollars)

per acre-foot, as shown in Table B-20A, by the amount of allocated water for each contractor, as shown in Table B-4.

The projected Delta Water Charges from 2013-2035 include the following assumptions:

1. *Escalation of projected operating costs at 3.0 percent per year for 2013 and 2014.*
2. *Escalation of projected operating costs at one percent per year for 2015-2035.*

Water System Revenue Bond Surcharge

Table B-22 summarizes the Water System Revenue Bond Surcharge (WSRB) to the Delta Water Charge and the transportation capital cost component for each contractor. The surcharge shown in Table B-22 includes the financing costs of the WSRB surcharge, Series B through Series AE. This surcharge is levied according to an amendment to the water supply contracts, which was signed by all long-term water supply contractors.

Total Water Charges

Table B-23 summarizes the total annual charges to each contractor (the sum of the Transportation Charge in Table B-19, the Delta Water Charge in Table B-21, and the Water System Revenue Bond Surcharge in Table B-22). The charges do not reflect past payments by contractors and are unadjusted for prior overpayments or underpayments.

Equivalent Total Water Charges

Table B-24 presents the Transportation Charge and Delta Water Charge in terms of the equivalent unit charge for each acre-foot of allocated water now projected for delivery to the respective contractors.

These equivalent charges would provide the same principal sum at the end of the project repayment period as annual payments to be made as part of the Delta Water Charge and Transportation Charge, plus interest at the Project Interest Rate, if applied to each acre-foot of allocated water delivered to date; all surplus water delivered prior to May 1, 1973; all Article 21 water deliveries in 1994 and after; and all allocated water now projected to be delivered during the remainder of the project repayment period (Table B-5B).

The equivalent unit Delta Water Charges included in Table B-24 are greater than those presented in Table B-20A because current projections of allocated water service are less for most contractors than the amounts shown in Table A.

Equivalent Water Costs by Reach

Table B-25 presents a summary of the equivalent unit transportation cost of conveying allocated water through respective aqueduct reaches of the Project Transportation Facilities.

Those unit costs provide the basis of charges assessed for extra service (such as delivery of allocations down-aqueduct from a contractor's turnout) and for wheeling service to entities other than the long-term water supply contractors.

The cumulative unit conveyance costs indicated for reaches in Table B-25 do not necessarily equal the equivalent unit Transportation Charges to contractors served from such reaches. The unit charges in Table B-24 account for the rate of water demand buildup and cost allocation factors of the individual contractors; however, the unit costs included in Table B-25 reflect the effect of melding the respective buildups and allocation criteria of all contractors whose allocations are conveyed through a given

reach. Table B-25 also includes surplus water delivered prior to May 1, 1973, and Article 21 water deliveries in 1994 and afterwards.

East Branch Enlargement Facility Charges

Table B-26 reflects DWR's projection of annual capital costs of the East Branch Enlargement Facilities for each aqueduct reach. These projections will be redetermined in future bulletins to include the following:

- A reallocation of costs of constructing the present east branch facilities between Alamo Powerplant and Silverwood Lake;
- A reallocation of costs of Silverwood Lake to reflect additional use as a result of East Branch Enlargement operation;
- A reallocation of costs of San Bernardino Tunnel to reflect redistribution of flow capacities necessary for the East Branch Enlargement facilities; and
- Actual enlargement construction costs.

These costs will be recovered with interest from the seven Southern California water contractors participating in the enlargement, in accordance with their amended water supply contracts (see *Table 10*).

Table B-27 lists the projected minimum OMP&R costs for each reach of the enlargement to be repaid by the seven East Branch Enlargement participating contractors. Currently, this table includes only minimum OMP&R costs attributable to the East Branch Enlargement. In accordance with Article 49(e)(1), the contractors participating in the East Branch Enlargement will also share in the remaining minimum OMP&R costs of the affected reaches, in accordance with a formula developed by DWR in consultation with the affected contractors.

Table B-28 shows each participating contractor's share of the estimated capital costs of the East Branch Enlargement shown in *Table B-26*.

Table B-29 shows the amounts of the annual capital cost components of the East Branch Enlargement Transportation Charge for each participating contractor. This component consists of each contractor's allocated share of debt service on bonds sold to finance the enlargement.

Table B-30 shows the minimum OMP&R components of the East Branch Enlargement Transportation Charge for each participating contractor for each year of the project repayment period. The amounts shown in *Table B-30* will recover the minimum OMP&R costs shown in *Table B-27*.

Table B-31 shows the annual East Branch Enlargement Transportation charges for each participating contractor (the sum of the corresponding amounts included in *Tables B-29* and *B-30*).

East Branch Extension Phase I Facility Charges

The East Branch Extension-Phase I charges recover associated costs for East Branch Extension facilities beginning at Devil Canyon Powerplant Afterbay and extending to the terminus at Noble Creek in the vicinity of Beaumont, Riverside County. These costs will be recovered from two contractors—San Bernardino and San Geronio—in accordance with their amended Water Supply contracts. The factors for distributing costs are shown in *Table 11*. *Table 12* shows the debt service for 2013.

Short-Term Agreements

DWR and the long-term water supply contractors execute short-term agreements that affect the contractors' charges. DWR executed a five-year agreement in 1997 with 16 municipal and industrial contractors, who agreed to pay for allocated shares of Municipal Water Quality Investigations costs. Additional amendments were executed in 2002, 2006, 2008 and 2010 to extend the program. The MWQI charges under this agreement are included in the transportation minimum OMP&R components shown in Table B-16A.

Nine contractors executed a short-term agreement (1997 and 1998) to participate in the feasibility study for the American Basin conjunctive-use program. Feasibility study costs are included in Table B-16A.

Contractors have agreed to participate in several Delta Improvement programs that started in 2007 and that will possibly extend into the future.

The first agreement pertains to the Bay Delta Conservation Plan (BDCP) agreed to in the Memorandum of Agreement for Supplemental Funding for Certain Ecosystem Actions and Support for Implementation of Near-Term Water Supply, Water Quality, Ecosystem, and Levee Actions (MOA). The BDCP comprises two elements: fishery costs and consultation costs. These costs were added to the contractors' transportation minimum component for bill years 2007, through 2012.

The second agreement pertains to the non-BDCP costs of the MOA, comprising the Delta Vision and pelagic organism decline research costs. These costs were added to the contractors' conservation minimum component for bill years 2007 and 2008.

The third set of agreements pertains to the Delta Habitat Conservation and Conveyance Program (DHCCP). The agreements are between the Department and 20 participating SWP contractors to provide 50 percent of the funding for the preliminary planning phase of an improved Delta water conveyance facility. (The remaining 50 percent is provided by the U.S. Bureau of Reclamation.) This program will assess potential habitat restoration and water conveyance options in the Delta. For bill years 2008 through 2011, nearly \$70 million in charges associated with the DHCCP were billed directly to the 20 participating SWP contractors as a separate line item in the Statements of Charges, and are not reflected in the tables in this appendix.

A fourth set of agreements pertains to both DHCCP and BDCP. For bill years 2012 and 2013, an Agreement for Supplemental Funding for the Costs of Environmental Analysis, Planning and Design of Delta Conservation Measures, Including Delta Conveyance Options, was executed in 2012 between the Department and 16 participating SWP contractors to provide 50 percent of the project funding. In 2012, \$22 million was billed and in 2013, \$28 million will be billed directly to the 16 participating contractors as a separate line item in the statements of charges.

(a) Starting with 2005 transmission costs that vary and depend on Power usage are included, therefore recovered through the variable component.

(b) Power costs for the period 1968 through 1987 are for an interim facility.

(c) The costs of Del Valle Pumping Plant are combined with those of South Bay Pumping Plant to simplify the cost allocations.

(d) 1988 advance allocation.

(e) In accordance with the Exchange Agreement between the noted agencies, MWDSC assumed responsibility for payment of variable OMP&R costs on the exchange water in reaches beyond Reach 22B, and Desert Water Agency and Coachella Valley Water District for such costs from the Delta through Reach 22B. The adjustment in deliveries in Reach 22B provides for compliance with provisions for the repayment of costs under the agreement. In 1993 and after the exchange takes place in Reach 26A.

(e) In accordance with the Exchange Agreement between the noted agencies, MWDSC assumed responsibility for payment of variable OMP&R costs on the exchange water in reaches beyond Reach 22B, and Desert Water Agency and Coachella Valley Water District for such costs from the Delta through Reach 22B. The adjustment in deliveries in Reach 22B provides for compliance with provisions for the repayment of costs under the agreement. In 1993 and after the exchange takes place in Reach 26A.

(f) Includes 1,650 AF recaptured from ground water storage in 1982, 10,000 AF in 1987, and 8,749 AF in 1988. This was water stored under DWR's Ground Water Demonstration Program.

(a) Includes certain costs to be assigned directly to Kern County Water Agency. Refer to Appendix B text discussion of Table B-16A under "Project Water Charges."

Tables B-12 through B-31

Note: Where applicable, the projected data values shown in this appendix are shaded and the bill year data are in **bold** type.

TABLE B-12 Variable OMP&R Costs to be Reimbursed through Variable OMP&R Component of Transportation Charge^a

(in dollars)

(a) Excludes extra peaking costs assigned directly to contractors. Refer to Appendix B text discussion of Table B-17 under "Project Water Charges."
 (b) Costs for the period 1968 through 1987 are for an interim facility.
 (c) The relatively minor costs of Del Valle Pumping Plant have been combined with those of South Bay Pumping Plant to simplify the allocation procedures.

(a) Excludes extra peaking costs assigned directly to contractors. Refer to Appendix B text discussion of Table B-17 under "Project Water Charges."

(d) These values represent a proportionate allocation of the total variable OMP&R costs of pumping and recovery plants (Table B-3) associated with net annual withdrawals from storage for Project Transportation Facilities. The allocation is determined annually by applying the following ratio, calculated from the data shown in Table B-6: "Reservoir Storage Changes" (withdrawals, as a positive value) conveyed through each plant, divided by "Total" annual quantity conveyed through each plant, in acre-feet. The costs so determined are accumulated for all upstream plants for each year, for each respective reservoir.

**TABLE B-12 Variable OMP&R Costs to be Reimbursed through
Variable OMP&R Component of Transportation Charge^a**

(in dollars)

- (a) Reimbursed through the capital cost component of the Delta Water Charge.
- (b) Negotiated settlements as to the magnitude of SWP planning costs from 1952 through 1978.
- (c) Reimbursed through the minimum OMP&R component of the Delta Water Charge. Credits for Gianelli power generation are reflected in these net costs.
- (d) Revenues credited through the capital cost component of the Delta Water Charge.
- (e) Revenues credited through the minimum OMP&R component of the Delta Water Charge.
- (f) Under amendments of Articles 22(e) and 22(g), planning and pre-operating costs of additional Project Conservation Facilities incurred through 2011 reflected in the Delta Water Charge.

Tables B-14 through B-31

Note: Where applicable, the projected data values shown in this appendix are shaded and the bill year data are in **bold** type.

TABLE B-14 Capital Costs of Transportation Facilities Allocated to Each Contractor

(in dollars)

Note: Allocated capital costs as a result of permanent water transfers under Monterey are not reflected on this Table.

(a) Costs from Table B-10 allocated to Solano County Water Agency are reduced herein by \$2,102,700 in 1986 and \$1,823,500 in 1987 under provisions of Amendment No. 10 to its water supply contract.

TABLE B-14 Capital Costs of Transportation Facilities Allocated to Each Contractor

(in dollars)

(a) 2010 through 2013 charges include Reid Gardner separation costs that are allocated to contractors based on theoretical energy use for years 1983-2010.

(b) Costs allocated to contractors in 1989 through 2002 are reduced by credits for Off-Aqueduct Power Facility costs allocated to the pumping of non-SWP water.

TABLE B-17 Unit Variable OMP&R Component of Transportation Charge

(in dollars per acre-foot)

(a) For the period 1968 through 1987, rates are for an interim facility.

(b) The relatively minor costs of Del Valle Pumping Plant have been combined with those of South Bay Pumping Plant to simplify the allocation procedure.

TABLE B-17 Unit Variable OMP&R Component of Transportation Charge

(in dollars per acre-foot)

TABLE B-20A Calculation of Delta Water Rates

Calculation in accordance with Article 53(i) of the Monterey Amendment

(Values in millions of dollars [\$] or millions of acre-feet [AF] discounted to 2012 at 4.610 percent per annum)

Procedure	Capital Cost Component		Minimum Operation, Maintenance, Power and Replacement Component (a)		Total Delta Water Rate	
	[1]		[2]		[3]	
Commencing in 2013						
Total Costs of "Initial" Project Conservation Facilities to be Reimbursed and Project Water Table A Amounts during the Project Repayment Period	\$6,519.44 (b)	389.28 AF	\$5,735.60 (c)	389.28 AF	\$12,255.04	389.28 AF
Less, Project Power Revenues to be Realized During the Project Repayment Period.	(3,272.46)		(2,704.21)		(\$5,976.66)	
Less, Delta Water Charges Paid and Project Water Table A Amounts, Prior to 2013	(2,419.09) (d)	(330.87) AF	(1,153.08)	(330.87) AF	(\$3,572.17)	(330.87) AF
TOTAL	\$827.89	58.41 AF	\$1,878.31	58.41 AF	\$2,706.21	58.41 AF
Rate Applicable in 2013	\$14.17	per acre-foot	\$32.16	per acre-foot	\$46.33	per acre-foot

Calculation under original provisions, without the Monterey Amendment

(for Plumas County, and Empire)

Procedure	Capital Cost Component		Minimum Operation, Maintenance, Power and Replacement Component (a)		Total Delta Water Rate	
	[4]		[5]		[6]	
Commencing in 2013						
Total Costs of "Initial" Project Conservation Facilities to be Reimbursed and Project Water Table A Amounts during the Project Repayment Period	6,503.91 (b)	389.28 AF	5,710.45 (c)	389.28 AF	12,214.35	389.28 AF
Less, Project Power Revenues to be Realized During the Project Repayment Period.	(3,272.46)		(2,704.21)		(5,976.66)	
Less, Delta Water Charges Paid and Project Water Table A Amounts, Prior to 2013	(2,419.09) (d)	(330.87) AF	(1,153.08)	(330.87) AF	(3,572.17)	(330.87) AF
TOTAL	812.36	58.41 AF	1,853.16	58.41 AF	2,665.52	58.41 AF
Rate Applicable in 2013	\$13.91	per acre-foot	\$31.73	per acre-foot	\$45.63	per acre-foot

- (a) Considering that all operating costs of Project Conservation Facilities will not vary with annual amounts of Project water delivered, and therefore are properly classified as "Minimum" OMP&R Costs. OMP&R costs exclude amounts for Conservation RAS.
- (b) Including net credits of \$4,850,000 for settlements as to the magnitude of Project Capital costs incurred prior to December 31, 1960, and net credits of \$6,678,320 for settlement as to the magnitude of Project Capital costs incurred during the 1961 through 1978 period.
- (c) Includes conservation power costs and credits at San Luis.
- (d) Applying all Delta Water Charges paid prior to 1970 to reimburse Capital costs (the charge was not divided into components until 1970).

TABLE B-20B Delta Water Rates by Facility

(in dollars per acre-foot)

Item	Capital Cost Component	Minimum Operation, Maintenance, Power and Replacement Component	Total Delta Water Rate
	[1]	[2]	[3]
Initial Conservation Facilities			
Oroville Division			
Water Supply and power costs (a)	66.67	44.02	110.69
Less, Oroville Power Revenues	<u>-39.66</u>	<u>-19.74</u>	<u>-59.40</u>
Subtotal	27.01	24.28	51.29
Delta Facilities (b)			
California Aqueduct, portion			
Reach 1	4.27	7.47	11.74
Reach 2A	2.49	0.96	3.44
Reach 2B	1.30	0.67	1.97
Reach 3	<u>0.89</u>	<u>0.38</u>	<u>1.28</u>
Subtotal	8.95	9.48	18.43
San Luis Facilities			
Planning and preoperating costs through 2011	3.67	0.00	3.67
45,000 AF relinquished costs	0.27	0.43	0.70
Less, Capital Cost Credits	-1.75	0.00	-1.75
Less, Delta Water Charges paid prior to 2013	<u>-56.02</u>	<u>-46.29</u>	<u>-102.32</u>
Rate applicable in 2013	14.17	32.16	46.33

(a) Includes revenue received from non-SWP contractors.

(b) Includes 1. Delta Facility planning costs, 2. Delta Studies costs, and 3. Suisun Marsh Facilities Costs.

TABLE B-21 Total Delta Water Charge for Each Contractor

(in dollars)

(a) Hypothetical charges, which, if assessed on all Table A water delivered to date, all surplus water delivered prior to May 1, 1973, and all Table A water estimated to be delivered during the remainder of the project repayment period (Table B-5B), would provide a sum at the end of the period financially equivalent to all Transportation Charge and Delta Water Charge payments required under a water supply contract, considering interest at the Project Interest Rate, 4.610 percent per annum.

**TABLE B-25 Equivalent Unit Transportation Costs of
Water Delivered from or through Each Aqueduct Reach^a**

(in dollars per acre-foot)

(a) Representative of transportation unit costs only; does not include a unit cost of conservation. The Delta Water Rate should be added to these values in order to approximate unit costs at canalside.

Includes surplus water prior to May 1, 1973.

(b) Hypothetical charges which, if assessed on all Table A water delivered to date, all surplus water delivered prior to May 1, 1973, and all Table A water estimated to be delivered during the remainder of the Project repayment period (Table B-5B), would provide a sum at the end of the period financially equivalent to all Transportation Charges required under the water supply contract considering interest rate at the Project Interest Rate of 4.610 percent per annum.

(c) The Water System Revenue Bond Surcharge equivalent unit rate is calculated by multiplying Column 1 by the ratio of the 2013 WSRB surcharge to the sum of the Transportation Capital and the Capital component of the Delta Water Charge.

**TABLE B-26 Capital Costs of Each Aqueduct Reach
to be Reimbursed through the Capital Cost Component
of the East Branch Enlargement Transportation Charge**

(in dollars)

(a) Under Article 49(d)(4)(A) of its contract, San Bernardino Valley Municipal Water District elected to pay a portion of its allocated costs of East Branch Enlargement in advance rather than to participate in payment of Water System Revenue Bonds. This election made via a letter of agreement signed June 1, 1987. As of June 1999, \$6,347,938 has been received from the San Bernardino Valley Municipal Water District.

CONVERSION FACTORS

Quantity	To convert from customary unit	To metric units	Multiply customary unit by	To convert to customary unit, multiply metric unit by
Length	inches (in)	millimeters (mm)●	25.4	0.03937
	inches (in)	centimeters (cm)	2.54	0.3937
	feet (ft)	meters (m)	0.3048	3.2808
	miles (mi)	kilometers (km)	1.6093	0.62139
Area	square inches (in ²)	square millimeters (mm ²)	645.16	0.00155
	square feet (ft ²)	square meters (m ²)	0.092903	10.764
	acres (ac)	hectares (ha)	0.40469	2.4710
	square miles (mi ²)	square kilometers (km ²)	2.590	0.3861
Volume	gallons (gal)	liters (L)	3.7854	0.26417
	million gallons (10 ⁶ gal)	megaliters (ML)	3.7854	0.26417
	cubic feet (ft ³)	cubic meters (m ³)	0.028317	35.315
	cubic yards (yd ³)	cubic meters (m ³)	0.76455	1.308
	acre-feet (af)	thousand cubic meters (m ³ x 10 ³)	1.2335	0.8107
	acre-feet (af)	hectare-meters (ha - m)■	0.1234	8.107
	thousand acre-feet (taf)	million cubic meters (m ³ x 10 ⁶)	1.2335	0.8107
	thousand acre-feet (taf)	hectare-meters (ha - m)■	123.35	0.008107
	million acre-feet (maf)	billion cubic meters (m ³ x 10 ⁹)◆	1.2335	0.8107
	million acre-feet (maf)	cubic kilometers (km ³)	1.2335	0.8107
Flow	cubic feet per second (ft ³ /s)	cubic meters per second (m ³ /s)	0.028317	35.315
	gallons per minute (gal/min)	liters per minute (L/min)	3.7854	0.26417
	gallons per day (gal/day)	liters per day (L/day)	3.7854	0.26417
	million gallons per day (mgd)	megaliters per day (ML/day)	3.7854	0.26417
	acre-feet per day (af/day)	thousand cubic meters per day (m ³ x 10 ³ /day)	1.2335	0.8107
Mass	pounds (lb)	kilograms (kg)	0.45359	2.2046
	tons (short, 2,000 lb)	megagrams (Mg)	0.90718	1.1023
Velocity	feet per second (ft/s)	meters per second (m/s)	0.3048	3.2808
Power	horsepower (hp)	kilowatts (kW)	0.746	1.3405
Pressure	pounds per square inch (psi)	kilopascals (kPa)	6.8948	0.14505
	feet head of water	kilopascals (kPa)	2.989	0.32456
Specific capacity	gallons per minute per foot of drawdown	liters per minute per meter of drawdown	12.419	0.08052
Concentration	parts per million (ppm)	milligrams per liter (mg/L)	1.0	1.0
Electrical conductivity	micromhos per centimeter (μmhos/cm)	microsiemens per centimeter (μS/cm)	1.0	1.0
Temperature	degrees Fahrenheit (°F)	degrees Celsius (°C)	(°F - 32)/1.8	(1.8 x °C) + 32

● When using "dual units," inches are normally converted to millimeters (rather than centimeters).

■ Not used often in metric countries, but is offered as a conceptual equivalent of customary western U.S. practice (a standard depth of water over a given area of land).

◆ ASTM Manual E380 discourages the use of billion cubic meters since that magnitude is represented by giga (a thousand million) in other countries. It is shown here for potential use for quantifying large reservoir volumes (similar to million acre-feet).

OTHER COMMON CONVERSION FACTORS

1 cubic foot=7.48 gallons=62.4 pounds of water

1 cubic foot per second (cfs)=450 gallons per minute (gpm)

1 cfs=646,320 gallons per day=1.98 af a day

1 acre-foot=approximately 325,851 gallons=43,560 cubic feet

1 million gallons=3.07 acre-feet

1 million gallons per day (mgd)=1,120 af a year
